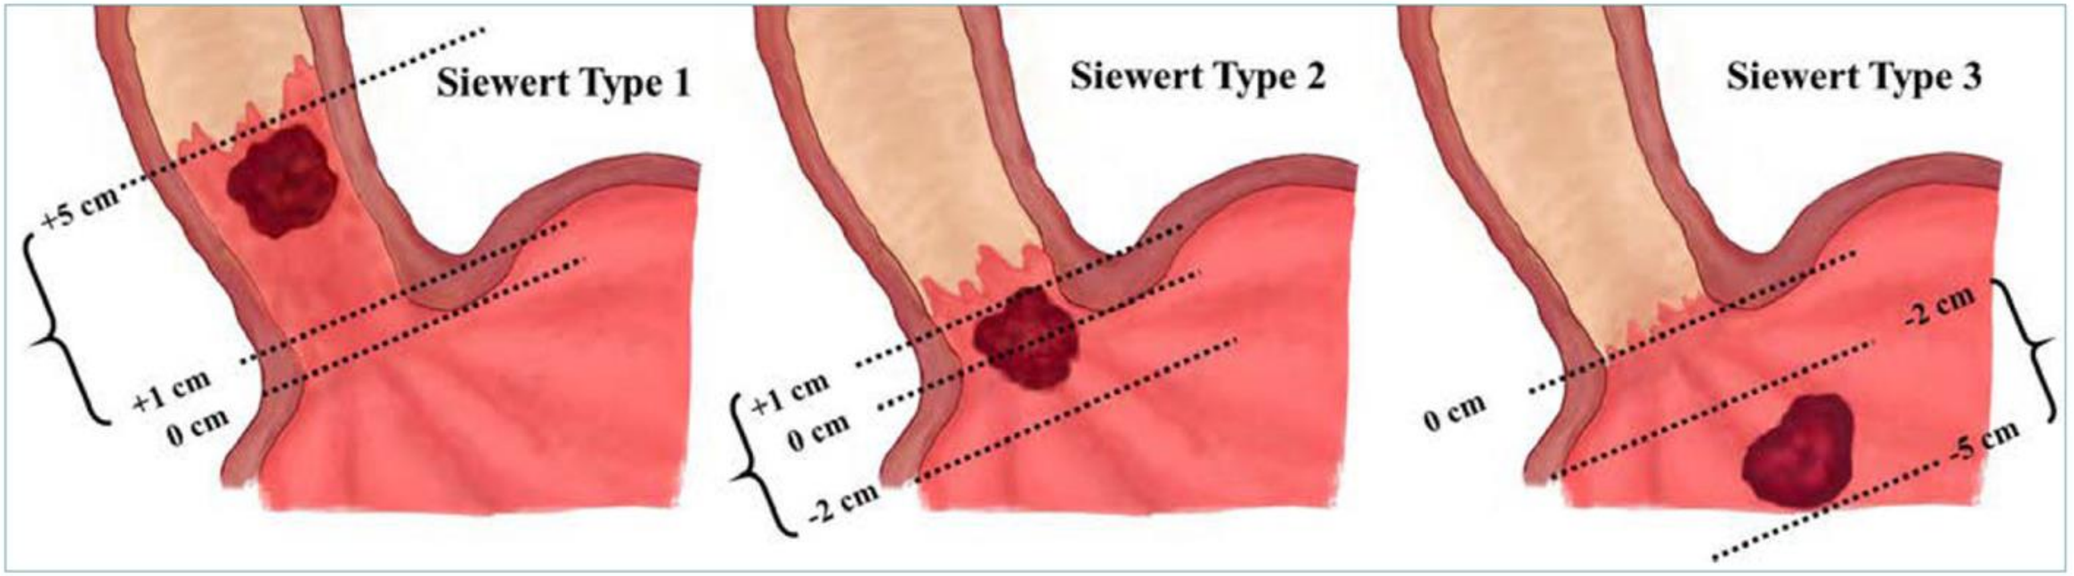
What we aim to cover during this presentation

- Importance of biomarker testing in GC
- Timing of GC biomarker testing
- Challenges in GC biomarker testing
- Novel biomarkers in the clinical scenario

WHO 2019

In this fifth-edition volume, adenocarcinomas of the esophagus and of the gastroesophageal junction are discussed **together** in a single section, because recent data suggest that these tumours share many etiological, histological, and biological features.



TYPE I	TYPE II	TYPE III
ADK of the distal esophagus	ADK of GEJ or cardia	ADK of subcardial stomach
ESOPHAGUS/GEJ		**GC**
G1 G2 G3		**Low High**
Glandular formation G1 >95%; G2 50-95%; G3 <50%		**Tubular and papillary**

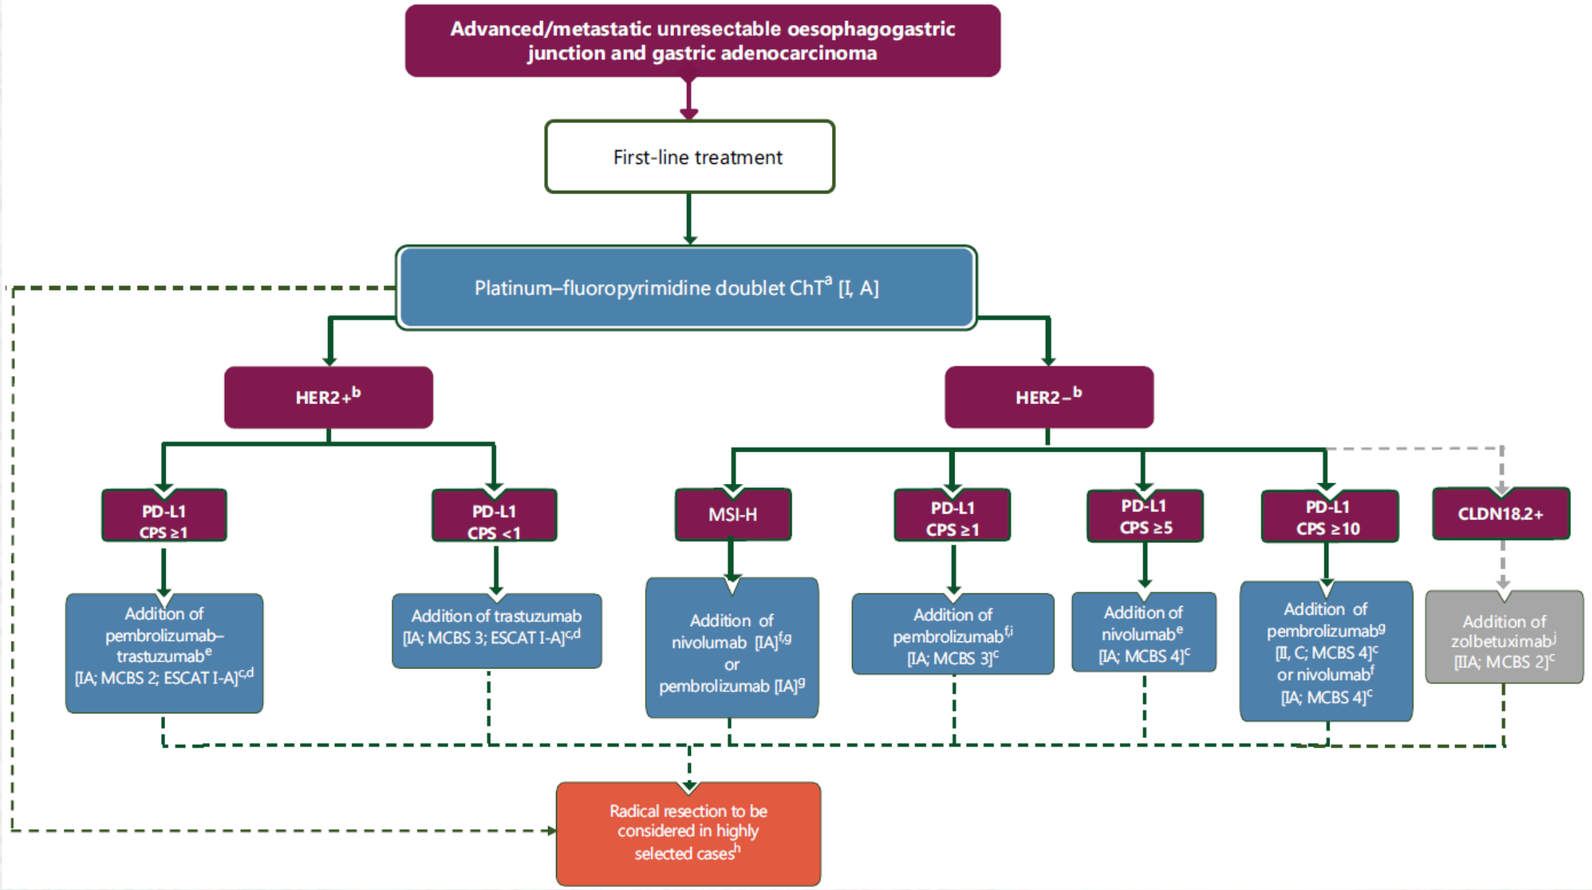
SPECIAL ARTICLE

Pan-Asian adapted ESMO Clinical Practice Guidelines for the diagnosis, treatment and follow-up of patients with gastric cancer



- Diagnosis should be made from multiple (5-8) endoscopic biopsies to guarantee an adequate representation of the tumour [IV, B].
- The histological diagnosis should be reported according to WHO criteria [V, B].
- HER2 expression by IHC and/or amplification by in situ hybridisation [I, A; ESCAT score: I-A], PD-L1 by IHC according to CPS [I, A] and MSI-H/dMMR [II, A; ESCAT score: I-B] are validated predictive biomarkers. Claudin 18.2 expression by IHC [I, A; ESCAT score: I-A] may be examined, if available.

SHORT COMMUNICATION

Factors affecting immunoreactivity in long-term storage of formalin-fixed paraffin-embedded tissue sections

Federica Grillo · Simona Pigozzi · Paola Ceriolo · Paola Calamaro · Roberto Fiocca · Luca Mastracci

Cold ischemia time	Fewer than 30 minutes if possible, not exceeding 1 hour
Fixative	10% neutral buffered formalin
Time of fixation (biopsy)	6 to 48 hours
Time of fixation (resection)	24 to 48 hours
Preparation	Paraffin-embedded sections, cut at a thickness of 3 to 5 µm
Specimen storage	Tissue blocks
Storage time for blocks	Fewer than 3 years for PD-L1 IHC
Storage conditions for blocks	Prevented from light, heat, and humidity
Storage time for cut sections	Fewer than 2 months, particularly for testing with SP263 antibody
Decalcification	EDTA, if necessary

Table 1. FFPE-Related Preanalytical Factors Categorized by the Extent Each Has Been Investigated in the Literature for Potential Effects on DNA, RNA, Protein, and Morphology Analytes

Comprehensive (All 4 Analytes Have Been Evaluated)	Incomplete (Some but Not All Analytes Have Been Evaluated)	Unexplored (No Analytes Have Been Evaluated)
Cold ischemia	Postmortem interval	Pathology ink
Decalcification	Warm ischemia time	Fixative age
Fixation duration	Specimen size	Commercial versus in-house fixative
Duration of paraffin block storage	Prefixation handling	Use of recycled formalin
	Fixative buffer	Movement during fixation
	Tissue to fixative ratio	Light exposure during fixation
	Fixation temperature	Fixation container
	Fixative delivery method	Fixation alone or with other biospecimens
	Dehydration reagent and conditions	Postfixation wash solution and conditions
	Clearing reagent and conditions	Reagents and conditions of interim alcohol storage
	Paraffin embedding reagent and conditions	Use of recycled dehydration and clearing reagents
	FFPE block size or section thickness	Automated versus manual processing
	Type of slide or adhesive	Use of recycled paraffin for impregnation and embedding
	Slide drying duration and temperature	Embedding conditions
	Storage duration of slide-mounted FFPE sections	Slide pretreatment
		Equipment and conditions of sectioning and section transfer

Abbreviation: FFPE, formalin-fixed, paraffin-embedded.

Biopsies

3.8 Gastric cancer

RECOMMENDATIONS

ESGE recommends at least six biopsies in cases of suspected advanced gastric cancer.
Strong recommendation, moderate quality of evidence.

ESGE recommends taking only one to two targeted biopsies for lesions that are potentially amenable to endoscopic resection (Paris classification 0-II) to confirm the diagnosis and allow subsequent endoscopic resection.
Strong recommendation, low quality of evidence.

Biomarkers can be evaluated only on invasive carcinoma
Mucin, ulcer, granulation tissue, DYSPLASIA are not useful

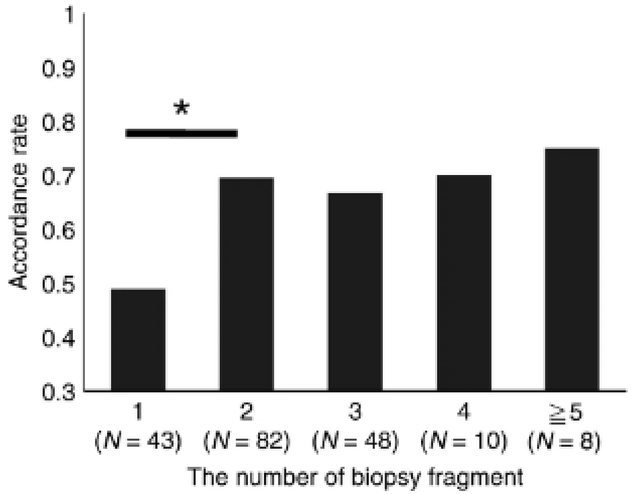
Endoscopists know they should take more than six neoplastic samples … right??

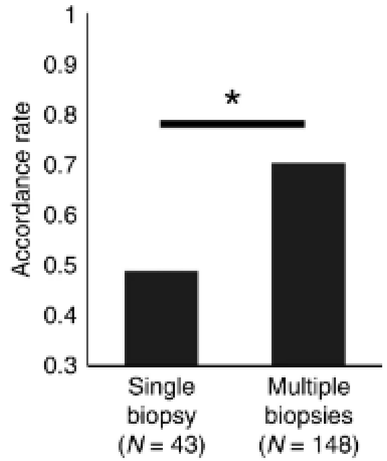
BJC British Journal of Cancer

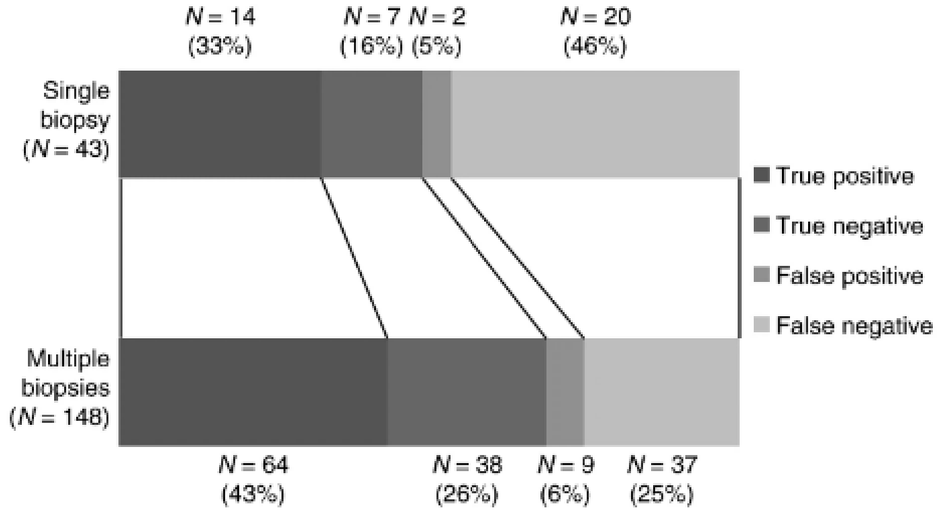
BRIEF COMMUNICATION
Cellular and Molecular Biology

Can PD-L1 expression evaluated by biopsy sample accurately reflect its expression in the whole tumour in gastric cancer?

Kohei Yamashita[1], Masaaki Iwatsuki[1,2], Kazuto Harada[1,2], Yuki Koga[1], Yuki Kiyozumi[1], Kojiro Eto[1], Yukiharu Hiyoshi[1], Takatsugu Ishimoto[1], Shiro Iwagami[1], Yoshifumi Baba[1], Yuji Miyamoto[1], Naoya Yoshida[1], Yoshihiro Komohara[3], Jaffer A. Ajani[2] and Hideo Baba[1]



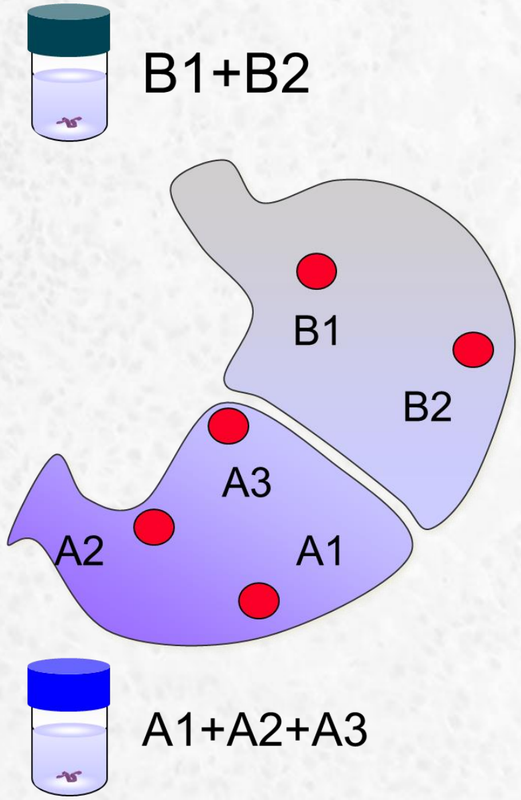




- The numbers of PD-L1-positive patients determined by biopsy and resected samples were 89 (46.6%) and 135 (70.1%), respectively
- The accordance rate was 64.4% ($\kappa = 0.31$)
- Single biopsy showed a lower accordance rate compared with multiple biopsies
- Our study revealed that single biopsy cannot fully reflect PD-L1 expression in the whole tumor in GC

Multiple biopsies are recommended for accurate diagnosis of PD-L1 expression in GC

Tissue-related influence on GC biomarkers' testing

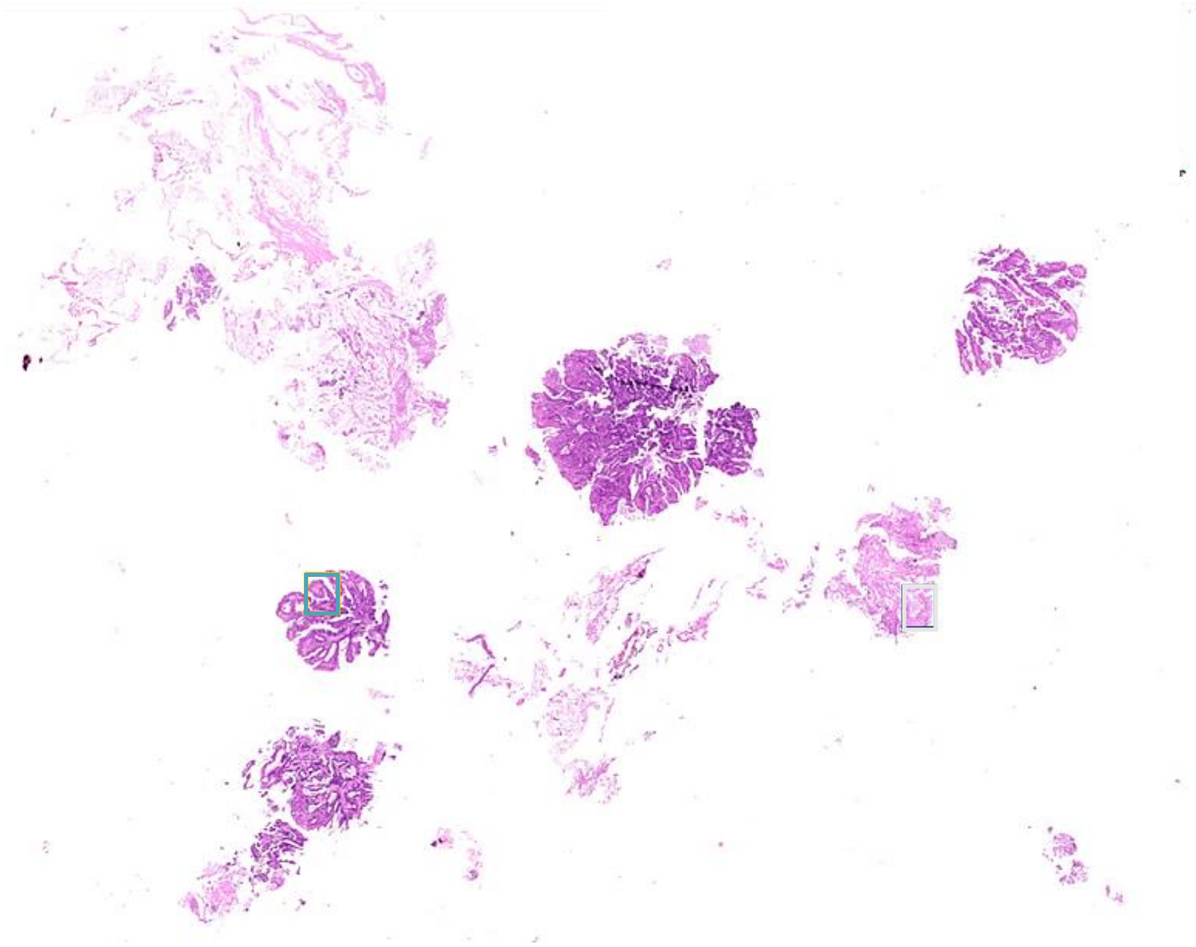


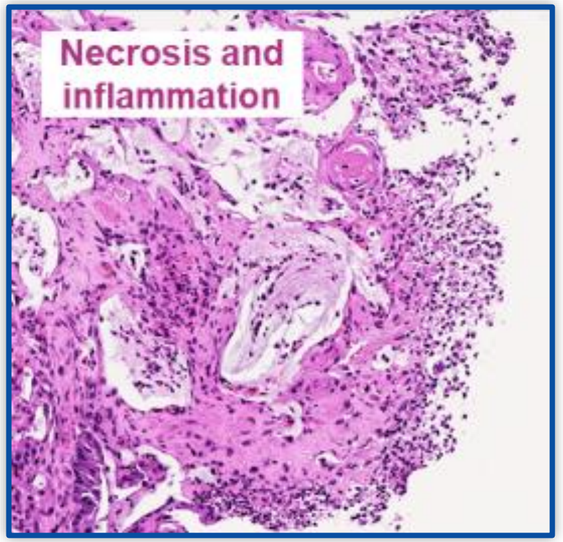
Biopsies ~70%

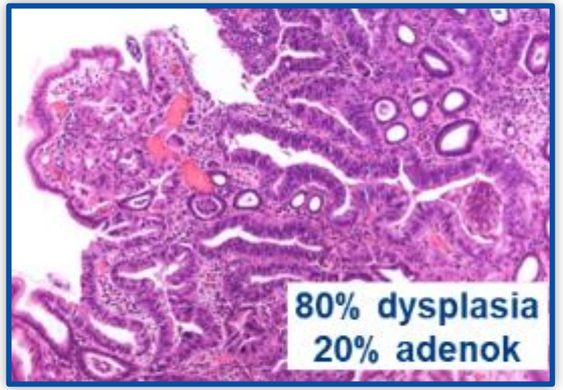
Surgery ~30%

Angerilli V, *et al.* – J Clin Pathol 2023

Not all biopsies are adequate for molecular testing!

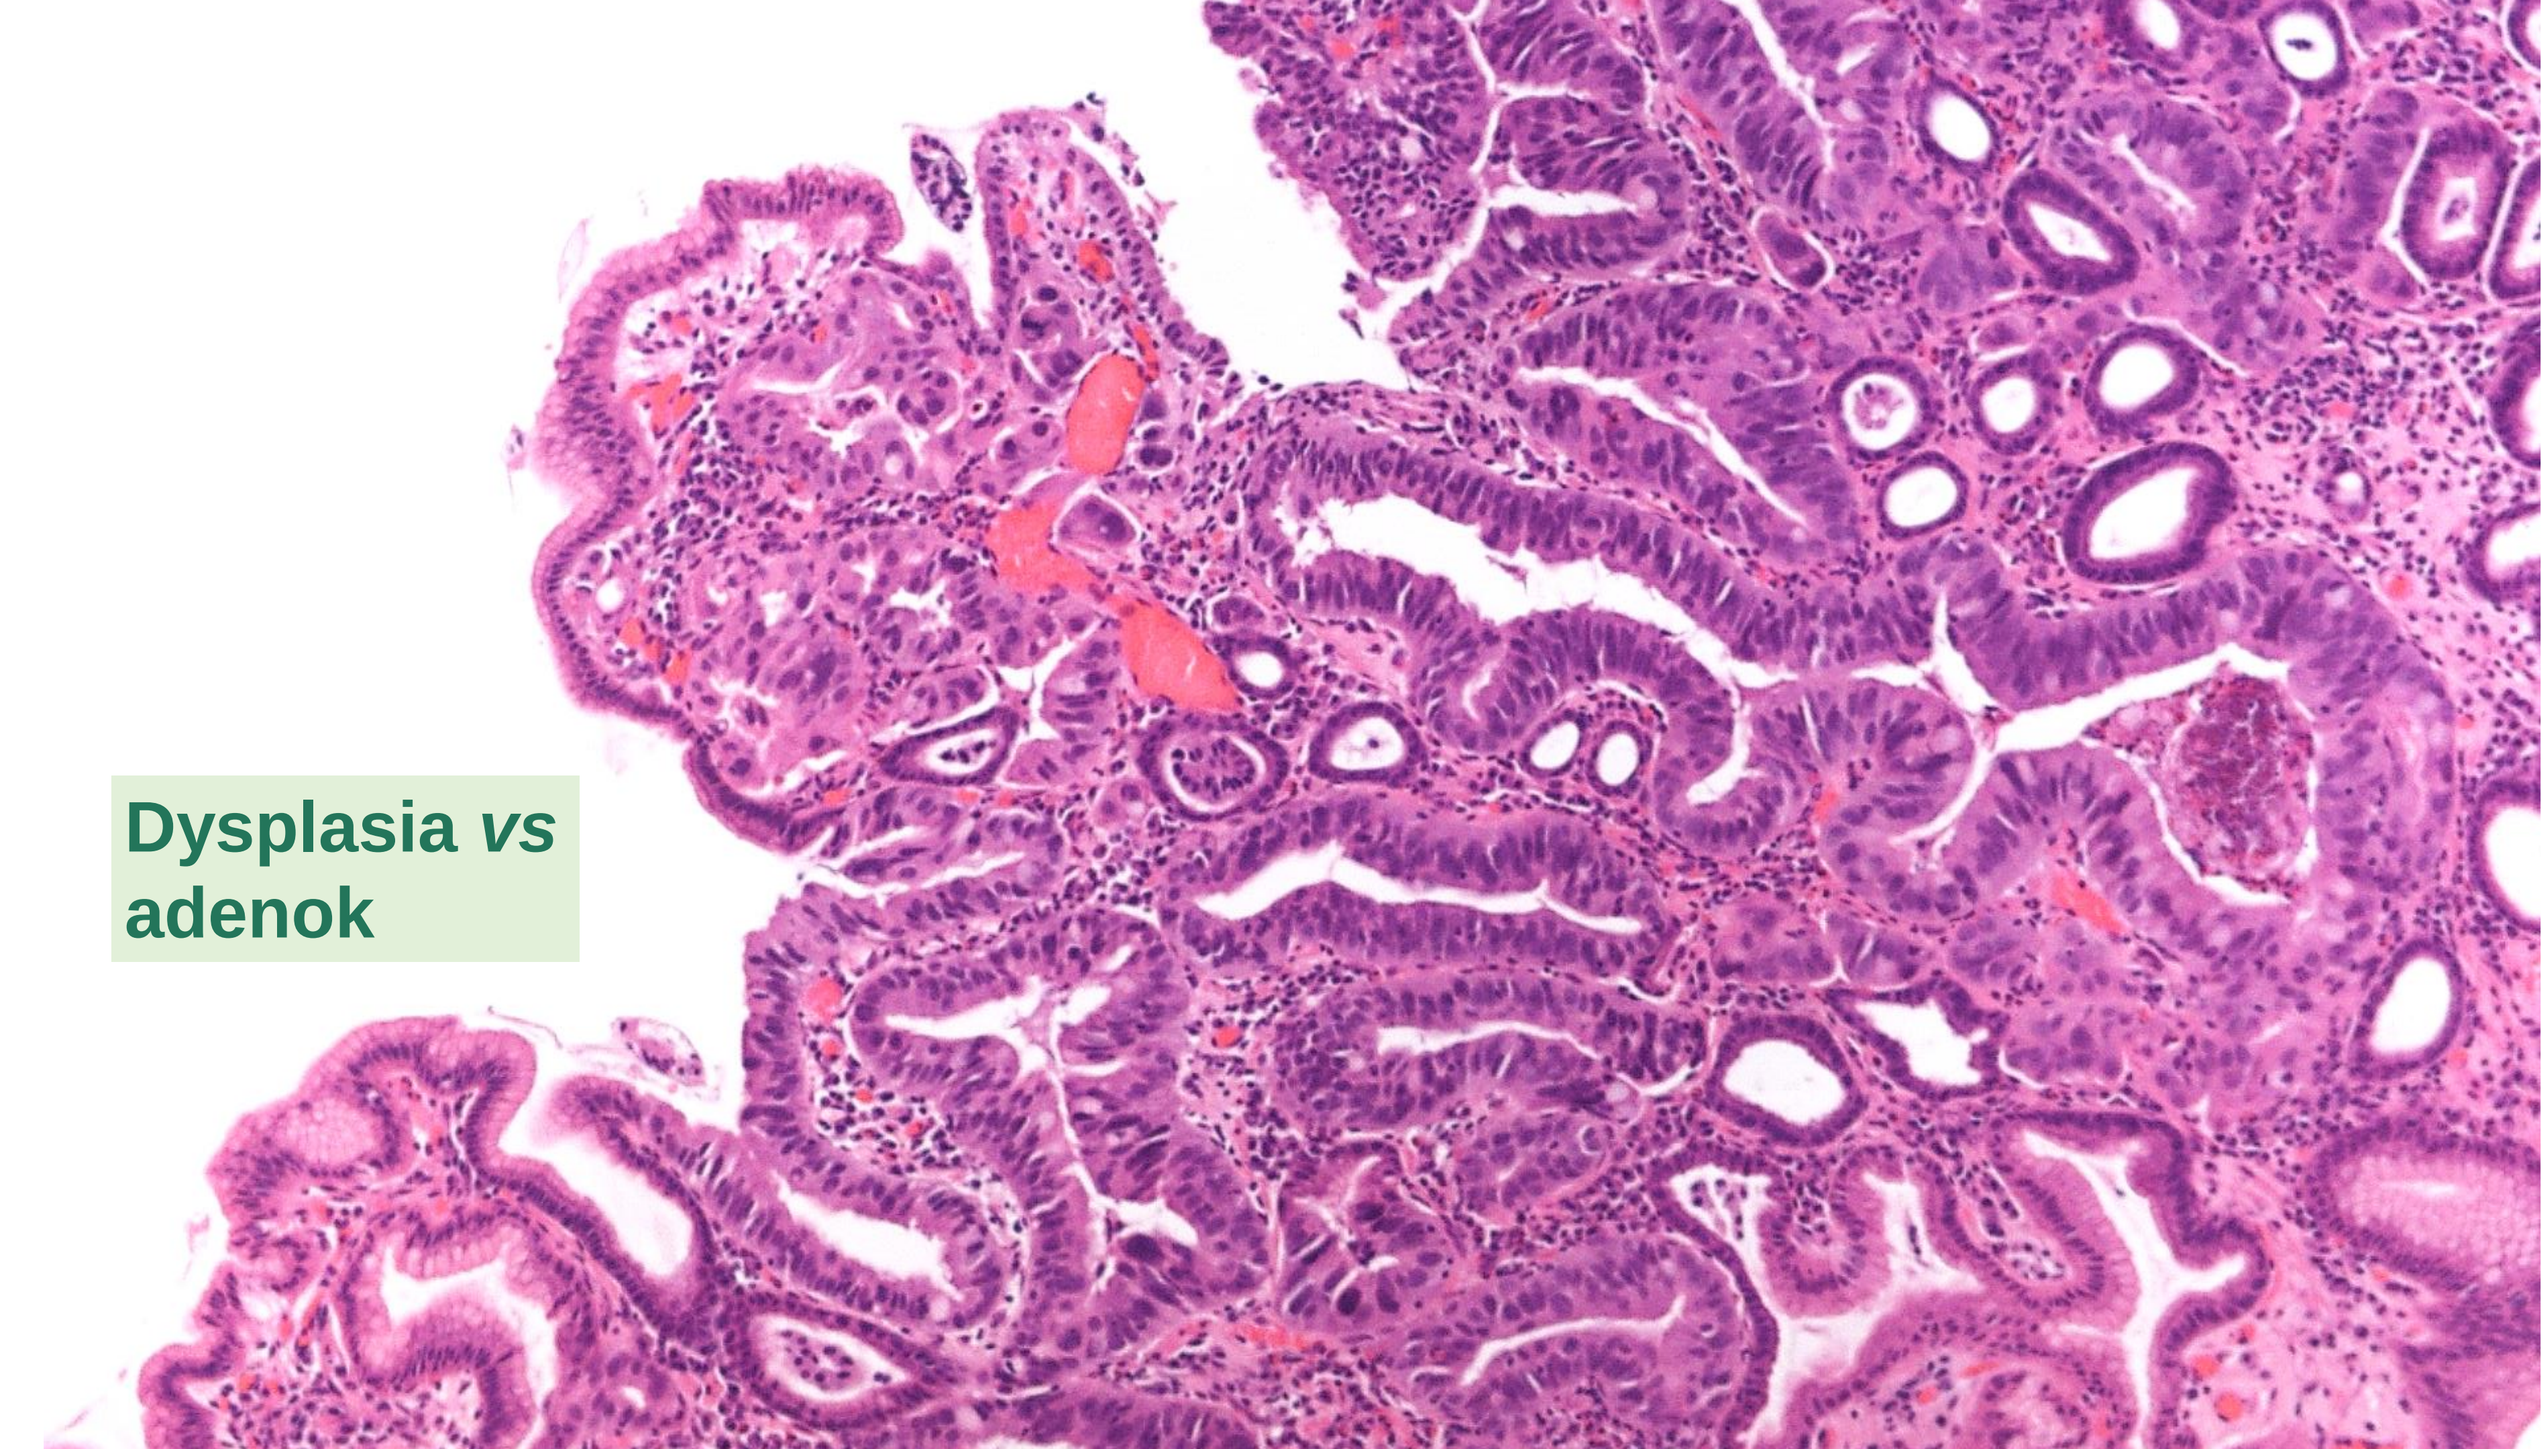




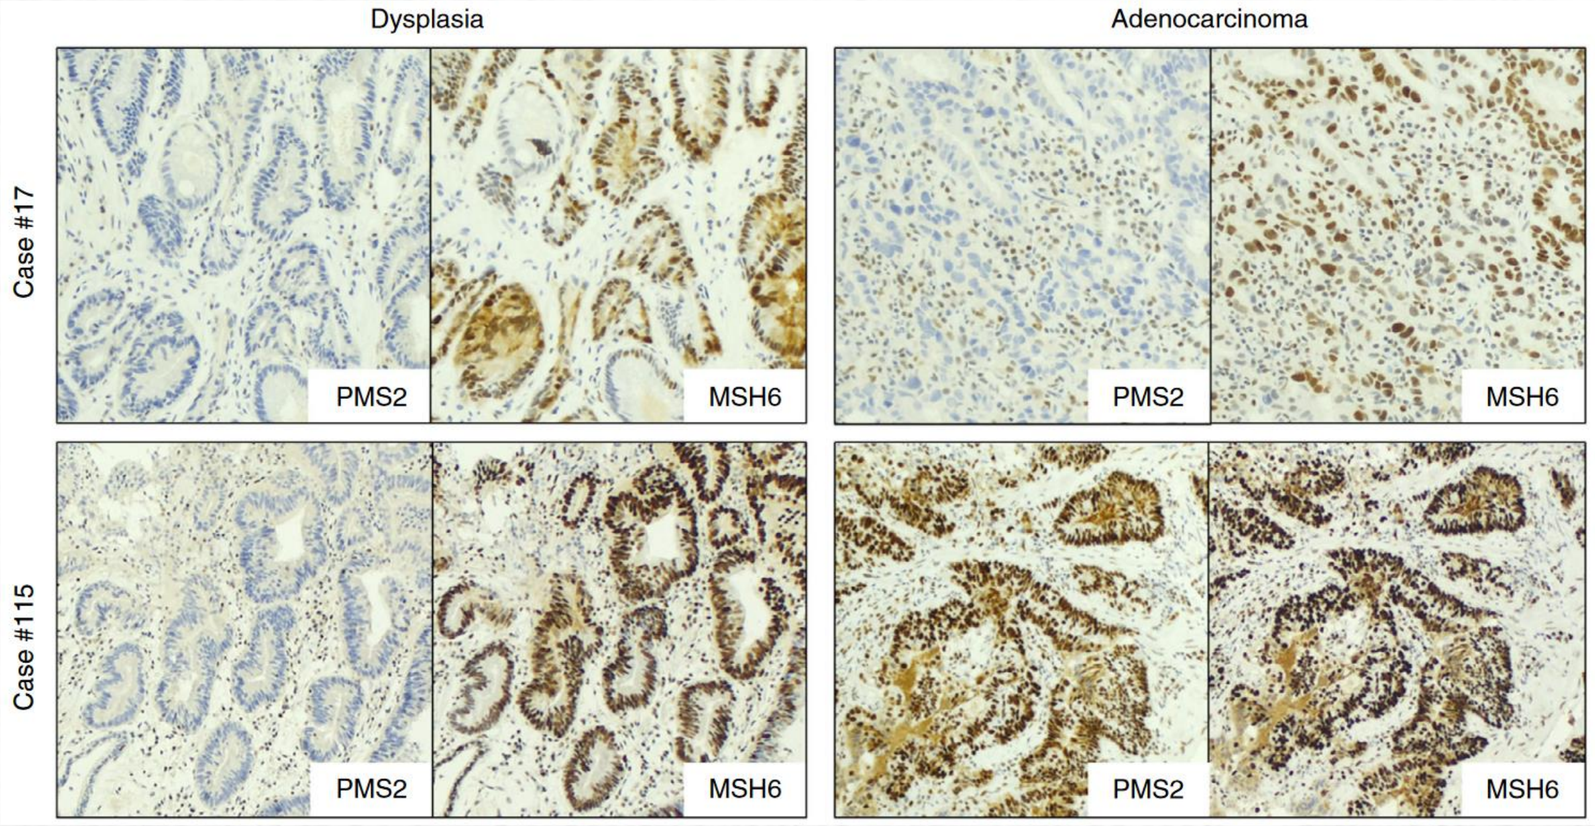


Parente P, *et al.* – Expert Rev Mol Diagn 2023

Dysplasia *vs* adenok



MMR status and GE dysplasia: need for a dedicated gastrointestinal pathologist?

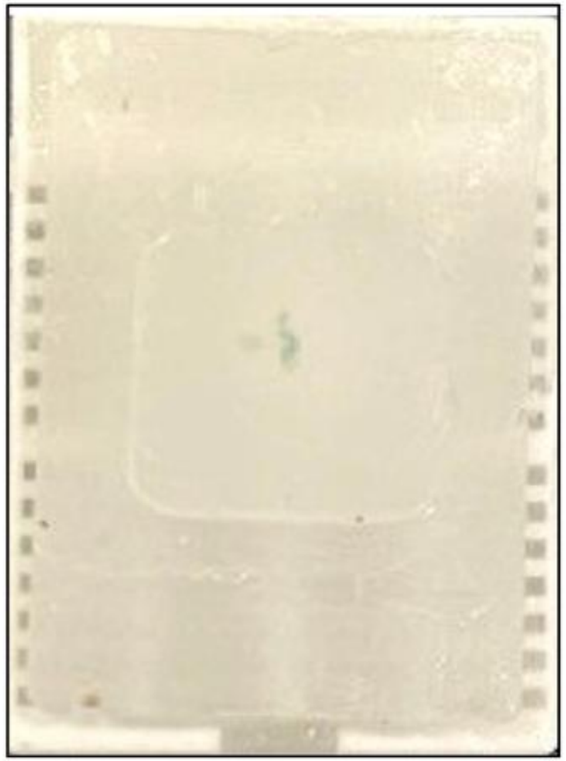


"…In fact, in certain circumstances, it may be challenging for non-expert gastrointestinal pathologists to make a proper distinction between preinvasive lesions and adenocarcinomas, thus hampering a correct biomarker status assessment, with important influences on the therapeutic decision-making process."

Angerilli V, *et al.* – Histopathology 2022

Dealing with the higher request of testing

Before IHC



After IHC

DIAGNOSIS

- 1 × 4 µm H&E
- 1 × 4 µm Giemsa
- 1 × 4 µm possible IHC (CK)
  + wastage 10–20 µm
  Total = around 20–30 µm

PREDICTIVE BIOMARKERS

- 1 × 4 µm HER2 (plus further 2 sections if 2+)
- 1 × 4 µm PD-L1
- 4 × 4 µm MMR
- 1 × 4 µm EBER
  + wastage 10–20 µm
  Total = around 30–50 µm

Parente P, *et al.* – Expert Rev Mol Diagn 2023

Heterogeneity

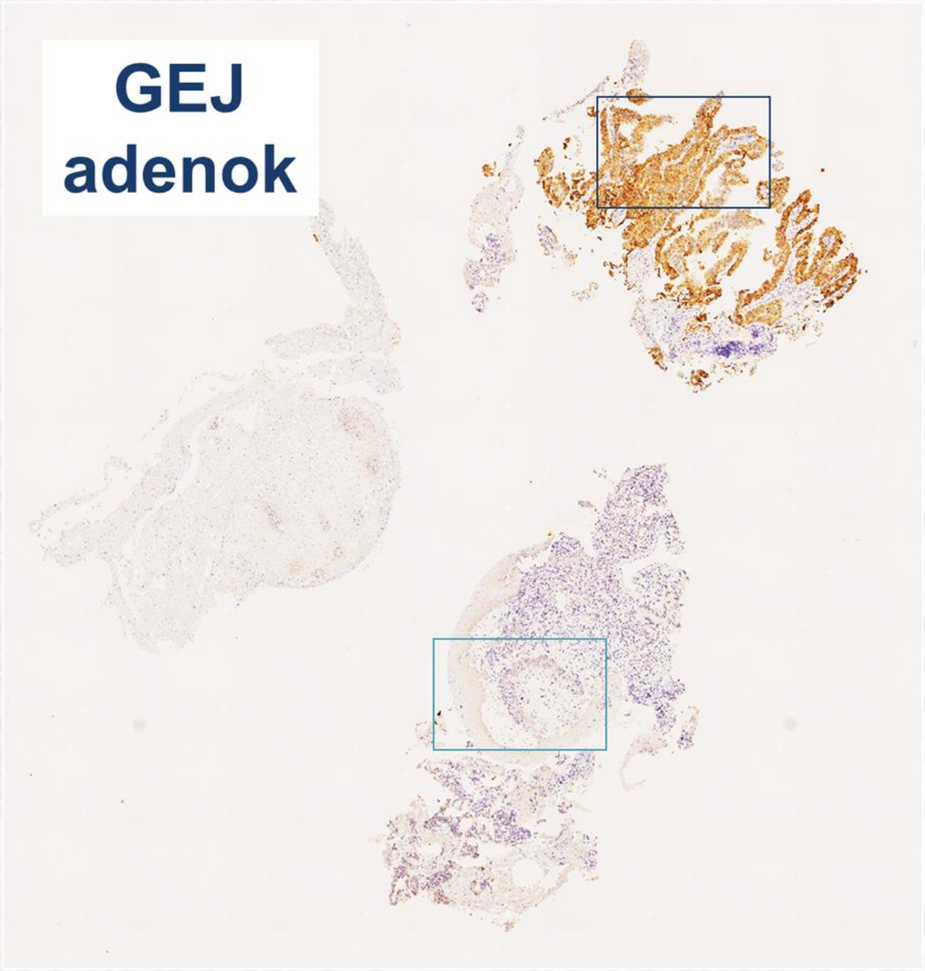
1. Within the tissue

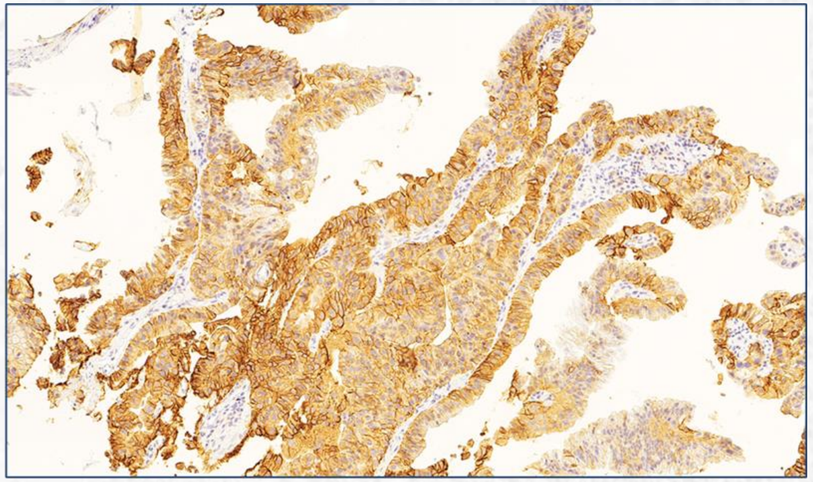
2. Between primary and metastases – between different metastatic sites – spatial

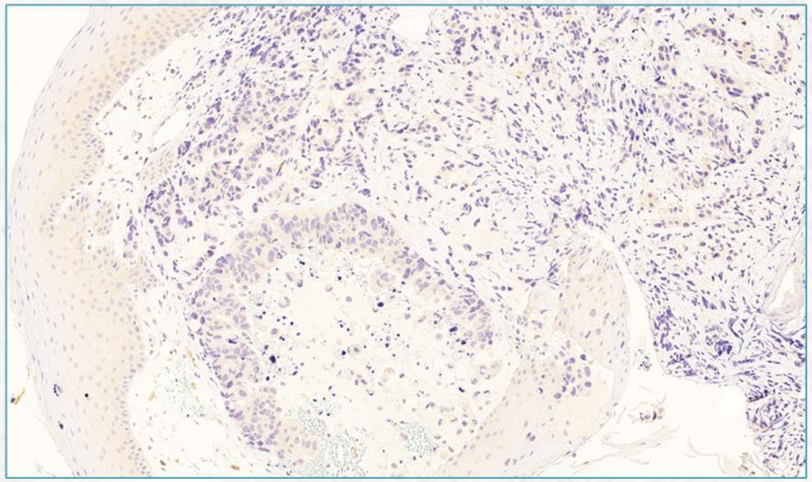
3. Differences in time – temporal

4. Treatment induced differences?

Gastric cancer as a heterogeneous disease







HER2
3+

HER2
0

HER2 status: spatial & temporal heterogeneity

HER2 status can change during the course of a patient's disease, differences between primary and metastases, between metastatic sites or in time

HER2 negative

Park et al. EurJCancer 2016

- **Repeat biopsy of primary (183 pts): 8.7%** of patients were shown to have HER2-positive gastric cancer
- **Repeat biopsy of metastatic and/or recurrent sites (175 pts): 5.7%** of patients turned out to have HER2-positive disease

HER2 positive

Seo et al. Gastric Cancer 2019

48 patients – baseline bx and bx at progression -

29.1% loss of HER2 at progression

- Patients with stable HER2 status - 44% RR, longer median PFS of 2.7

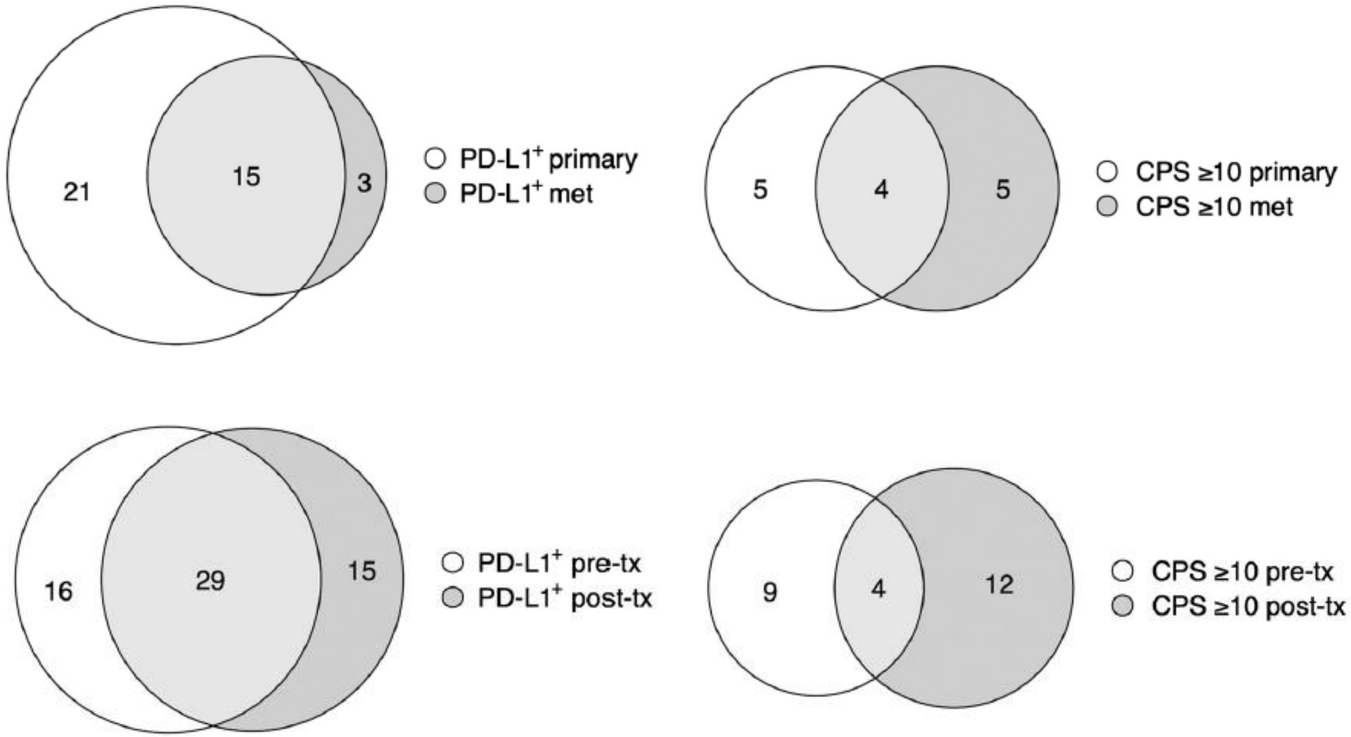
Fornaro L, *et al.* – Gastric Cancer 2023

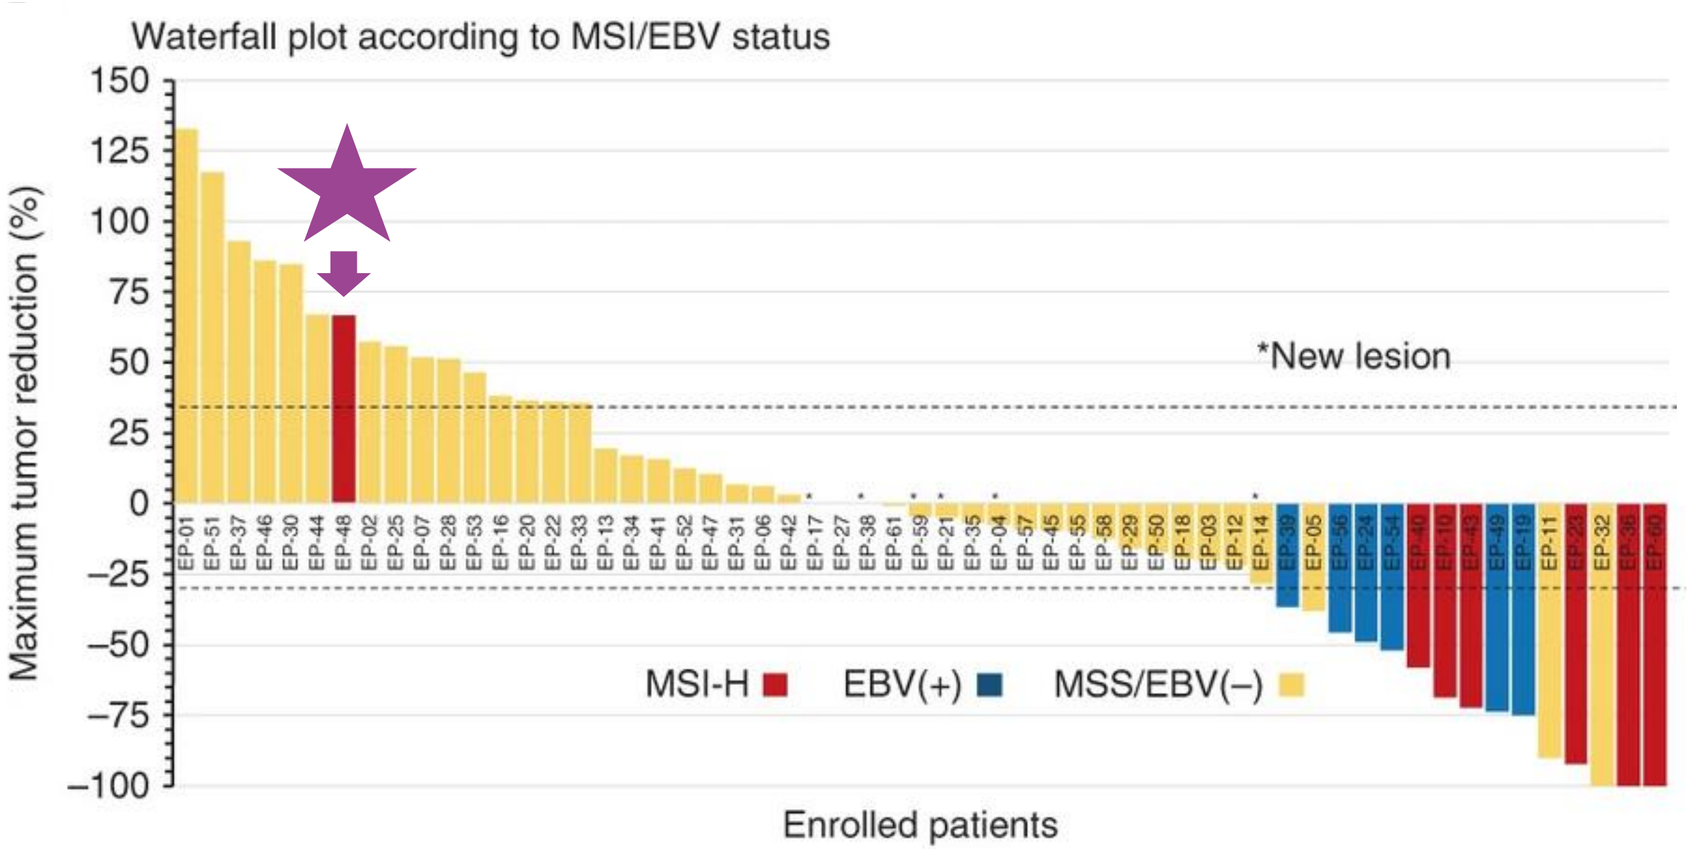
PD-L1: spatial and temporal heterogeneity

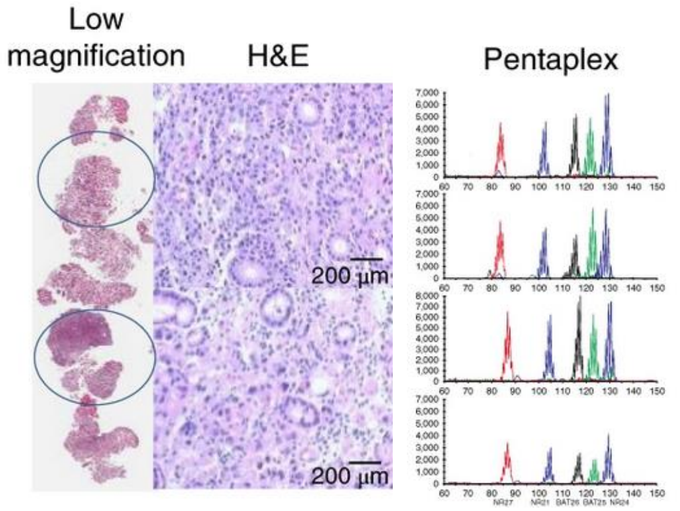


PD-L1 expression and TMB exhibit marked spatial and temporal heterogeneity in GEA. This heterogeneity should be considered when obtaining tumor samples for molecular testing and when deciding whether ICI therapy is appropriate.

Zhou KI, *et al.* – Clin Cancer Res 2020

Lack of response in an MSI-H patient associates with a heterogeneous MMR status!





MMR/MSI heterogeneity!

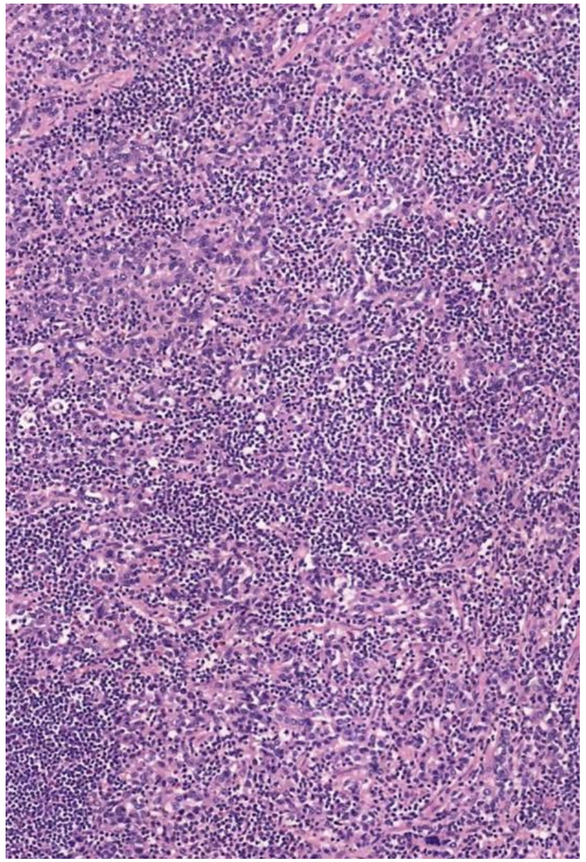
Kim ST, *et al.* – Nat Med 2018

Standardizing and prioritization of biomarker testing pathway

How do we prioritize?

Can we use site/morphology to choose?

HER2: > intestinal type, > GEJC
MMR: > lymphocyte rich, heterogeneous, solid poorly differentiated
Claudin18.2: > diffuse

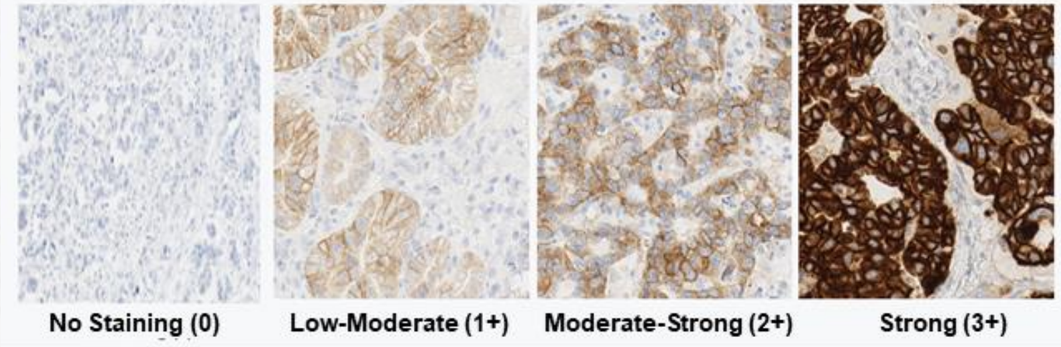


Novel diagnostics horizons

Despite a landscape clouded in complexity, emerging biomarkers are expanding our view of patient populations, and biomarker testing could provide a more comprehensive patient profile in the precision oncology era.

FGFR2b as a new target in gastric cancer

- 30.2% of metastatic G/GEJ adenocarcinomas were positive for FGFR2b expression
- FGFR2b genomic aberrations rarely overlap with other common GC genomic aberrations such as *HER2*, *MET and* other RTK biomarkers
- A Phase 2 study has demonstrated that the anti-FGFR2b mAb, bemarituzumab, plus mFOLFOX6 is generally well tolerated and has anti-tumour activity in G/GEJ cancer patients



FGFR2b IHC+ defined as 2+/3+ staining

ANATOMICAL PATHOLOGY

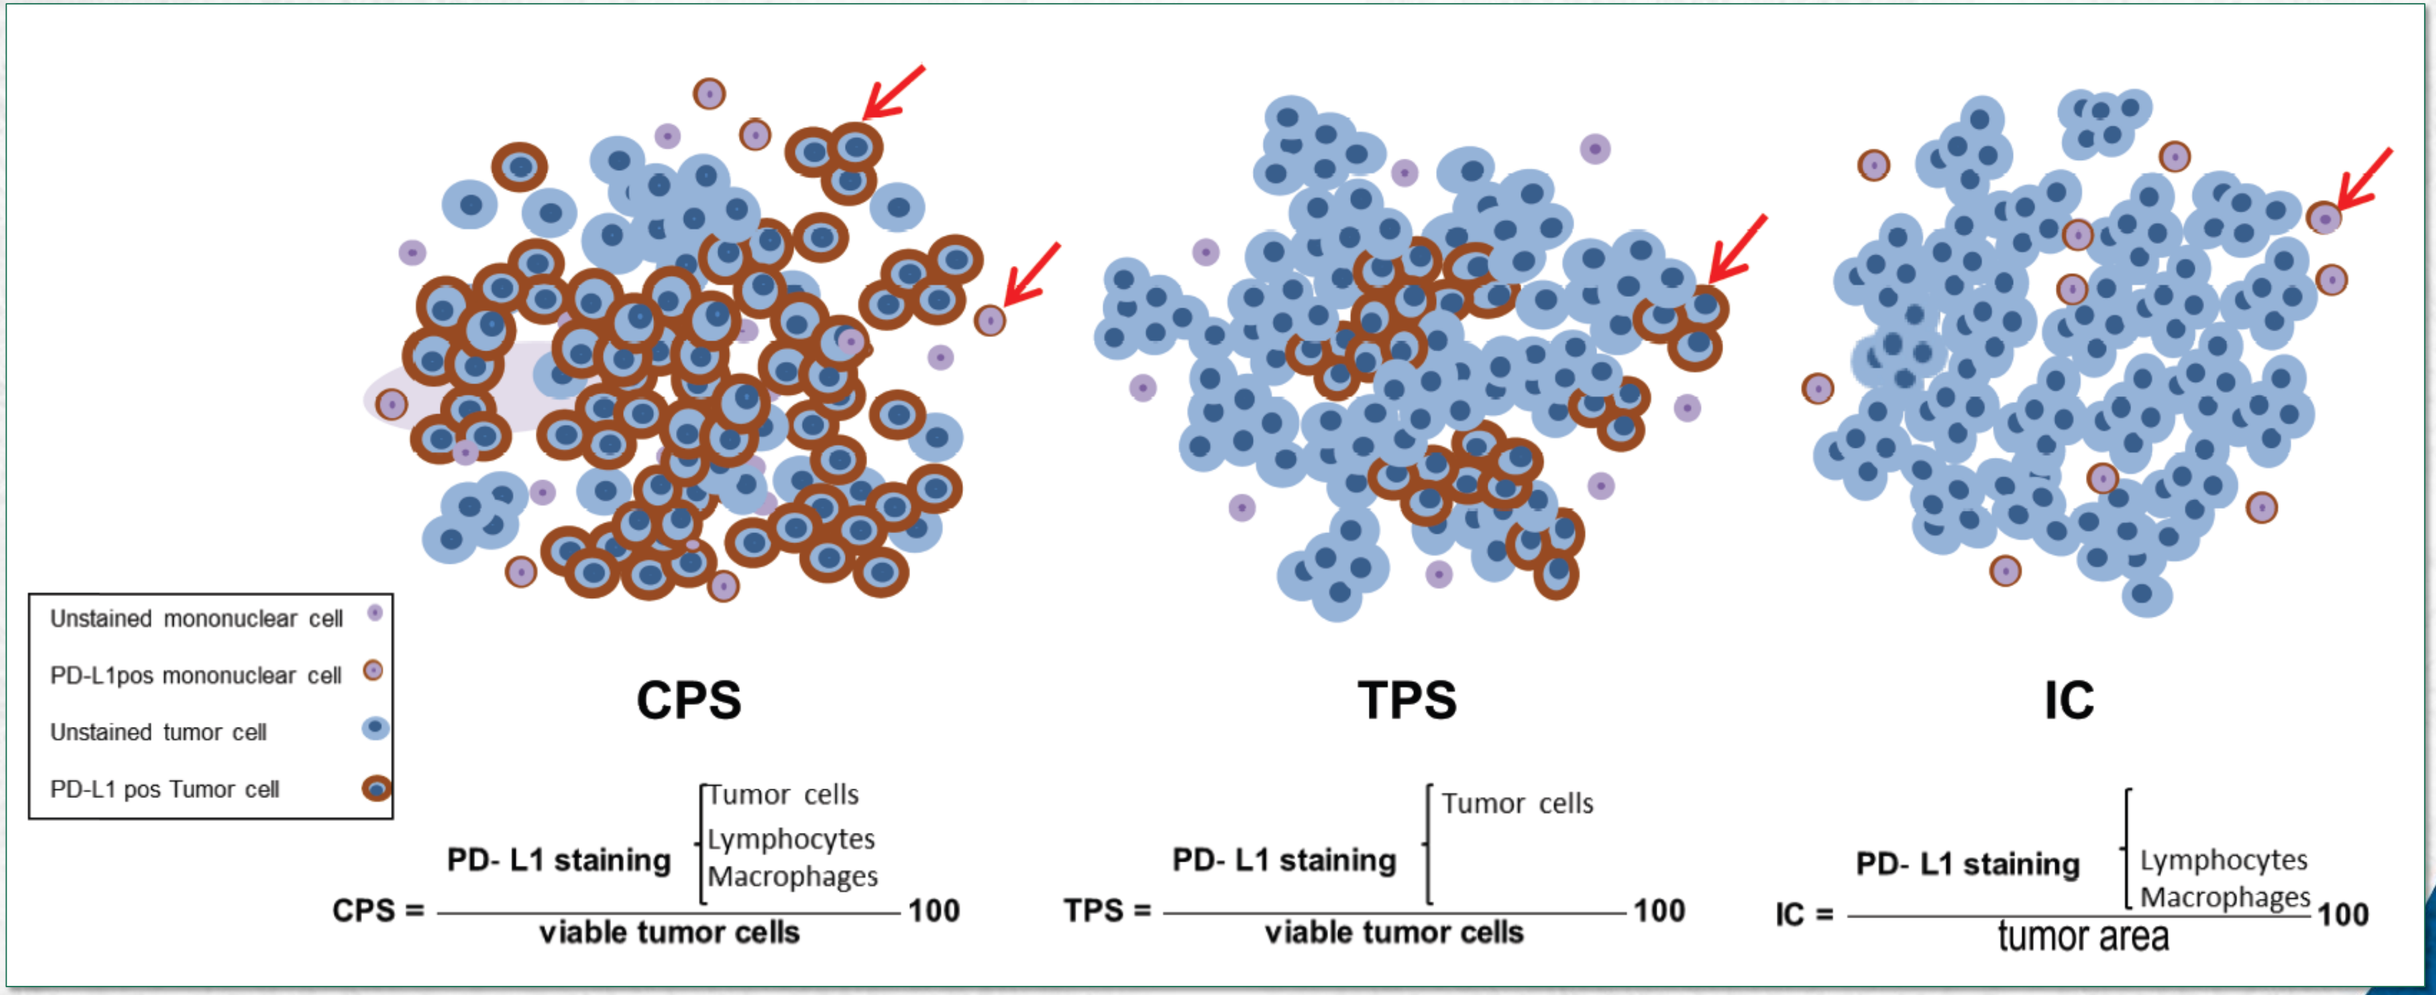
Comparison of PD-L1 immunohistochemical assays in advanced gastric adenocarcinomas using endoscopic biopsy and paired resected specimens

So-Woon Kim[1,2], Gowun Jeong[3], Min-Hee Ryu[4], Young Soo Park[1]

Until stronger evidence of inter-assay concordance is found, we urge caution in treating the various assays as equivalent.

DO NOT USE SP142 FOR GC/GEJ/EC

PD-L1 scoring algorithms



Sajjadi E, *et al.* - Ecancermedicalscience 2020

PD-L1 inter-pathologists' agreement (yes, they are reproducible)

Arch Pathol Lab Med. 2019;143:330–337; doi: 10.5858/

Clinical Utility of the Combined Positive Score for Programmed Death Ligand-1 Expression and the Approval of Pembrolizumab for Treatment of Gastric Cancer

Karina Kulangara, PhD; Nancy Zhang, MD; Ellie Corigliano, PhD; Lindsay Guerrero, MS; Stephanie Waldroup, BSc; Dipeshkumar Jaiswal, MS; Malinka Jansson, MS; Supriya Shah, PhD; Debra Hanks, MD; Jiangdian Wang, PhD; Jared Lunceford, PhD; Mary J. Savage, PhD; Jonathan Juco, MD; Kenneth Emancipator, MD

External reproducibility assessments demonstrated:

- Inter-pathologist overall agreement of 96.6%
- Intra-pathologist overall agreement of 97.2%

PD-L1 inter-pathologists' agreement (no, they aren't reproducible)

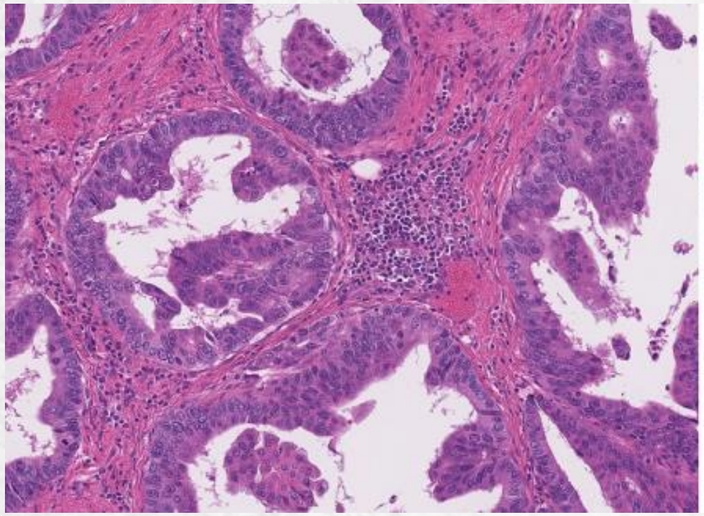
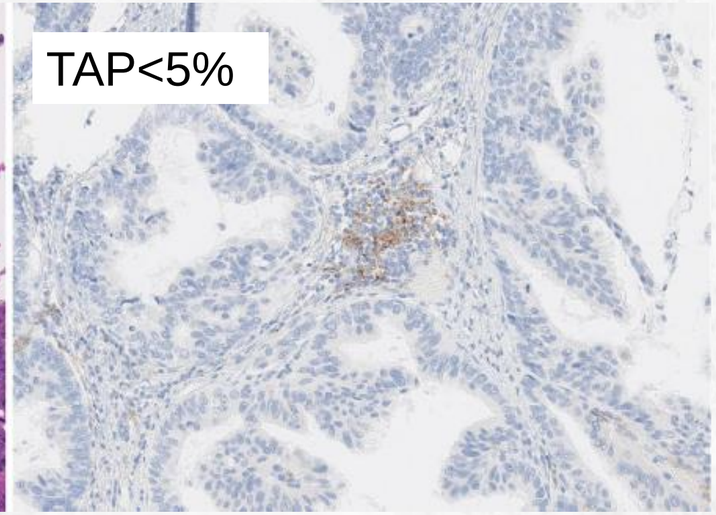
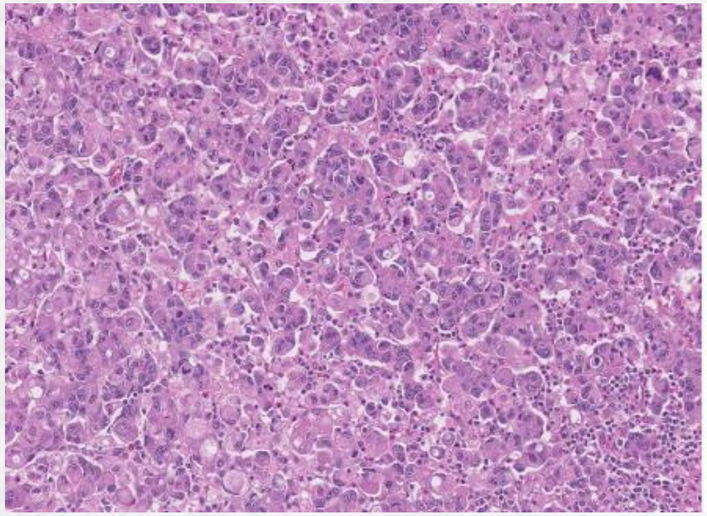
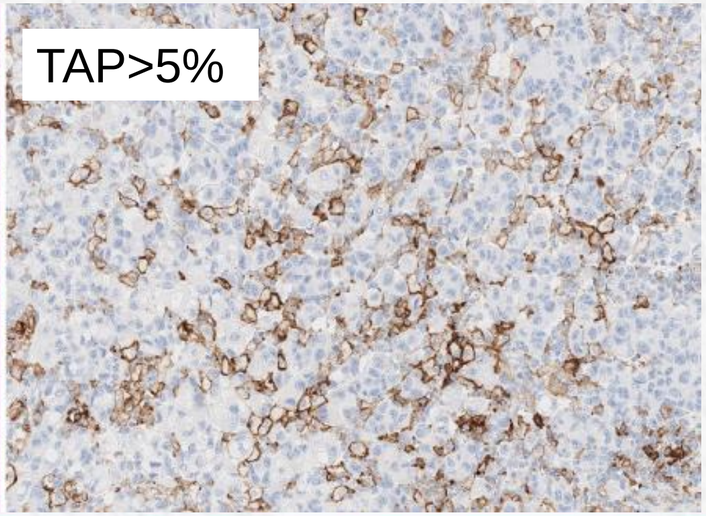
Tumor Area Positivity (TAP) score of PD-L1: a novel visual estimation method for combined tumor cell and immune cell scoring

34º Congresso Brasileiro de PATOLOGIA
27º Congresso Brasileiro de CITOPATOLOGIA
29/05 a 01/06/2024 Belém/PA
INOV AÇÃO INTEGR



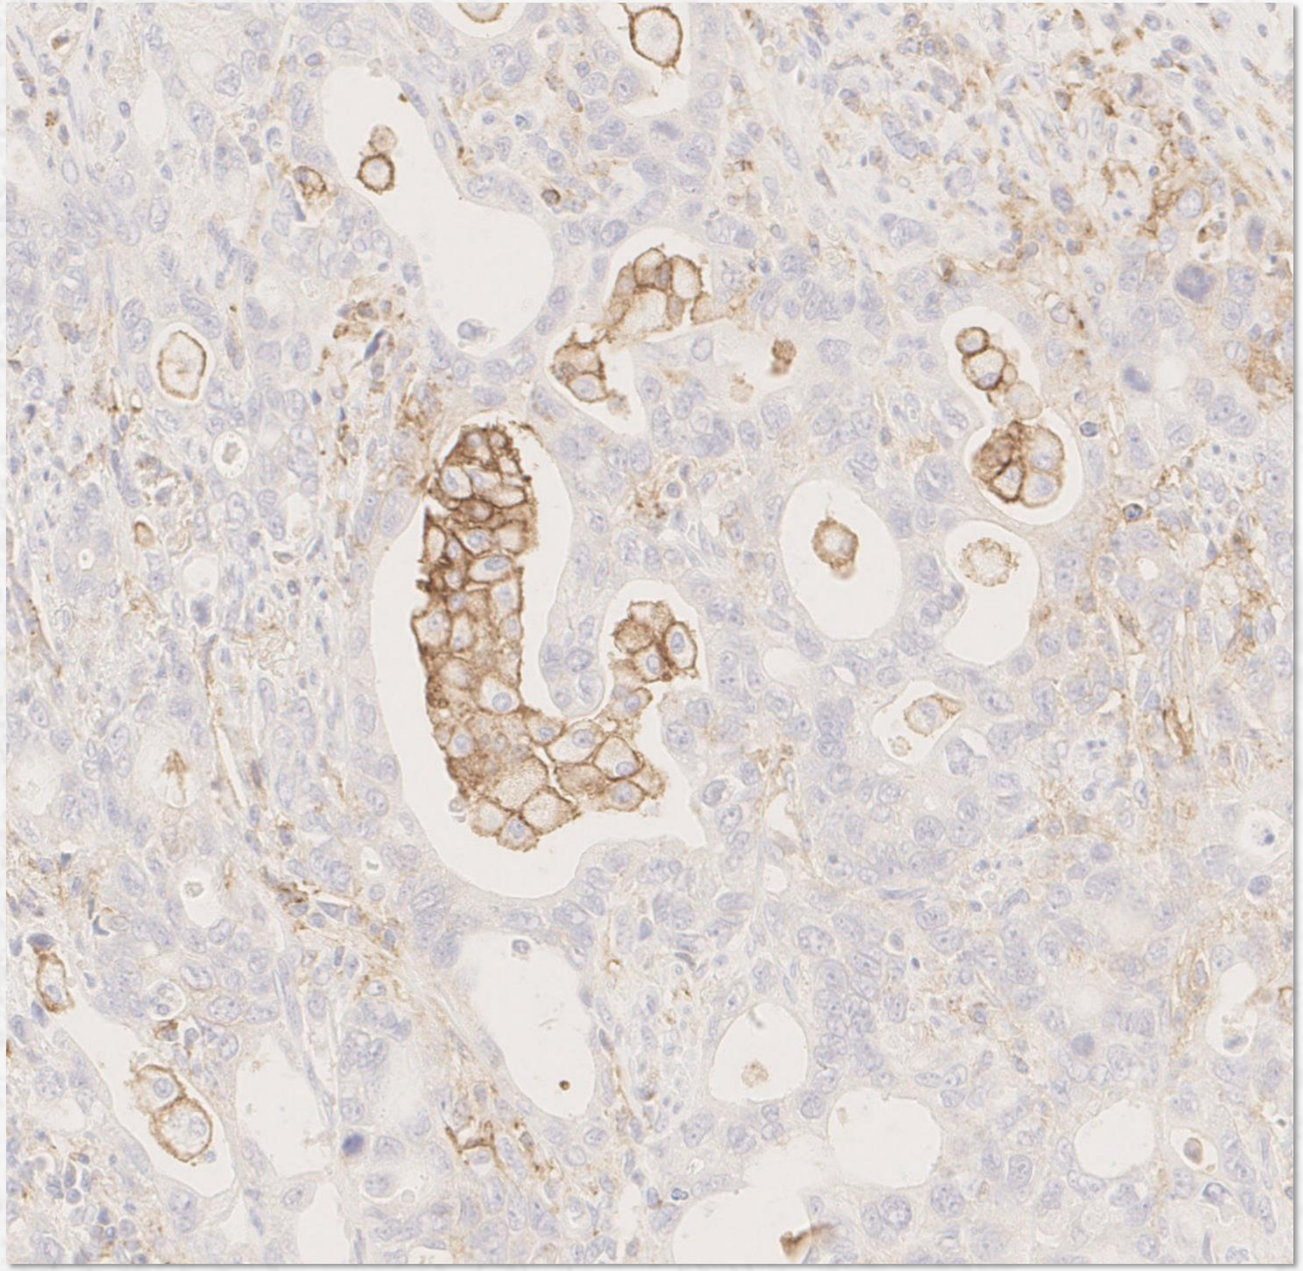






- The average positive agreement, average negative agreement, and overall percent agreement between and within readers were all above 85% for both internal and combined external reader precision studies.
- TAP score had high concordance rate at 5% cutoff compared with CPS at cutoff 1.
- TAP scoring method to be straightforward, significantly less time-consuming, and highly reproducible with a high concordance rate between TAP score and CPS.

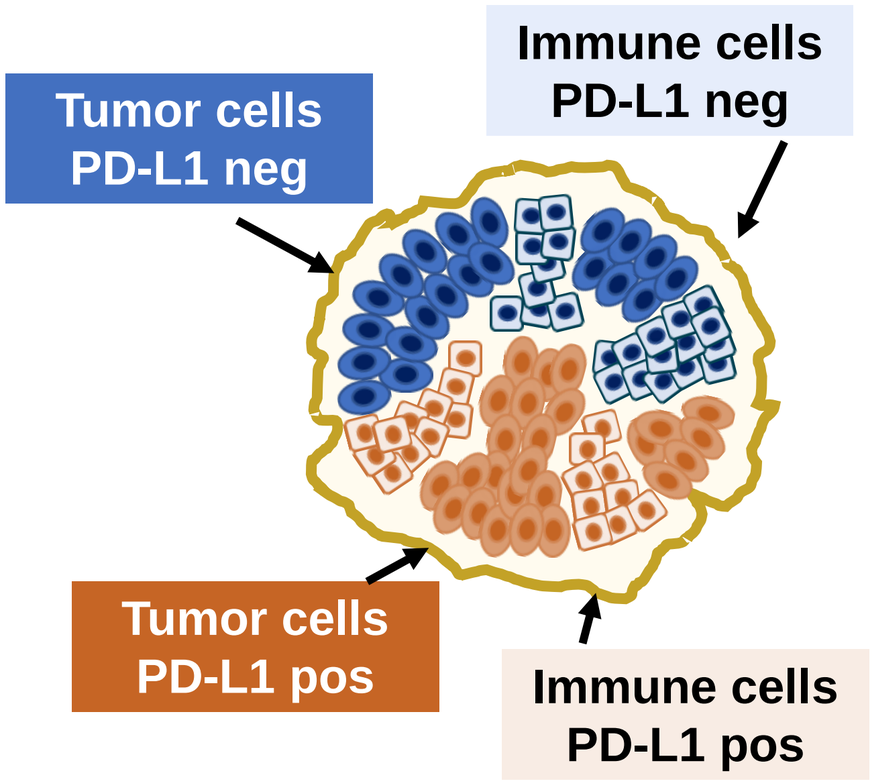
Liu C, *et al.* – Diagn Pathol 2023



- **<u>Intra-luminal macrophage</u>** staining is not included in the TAP score unless the macrophages completely fill the luminal space and are in direct contact with the TC.

- Staining of **<u>multi-nucleated giant cells, granulomas, and IC located within blood vessels</u>** and lymphatics are not included in the TAP score.

Liu C, *et al.* – Diagn Pathol 2023



Cell counting

CPS*

Number of TCs with PD-L1 expression + Number of ICs with PD-L1 expression

Total number of viable TCs

*ICs= lymphocytes, macrophages

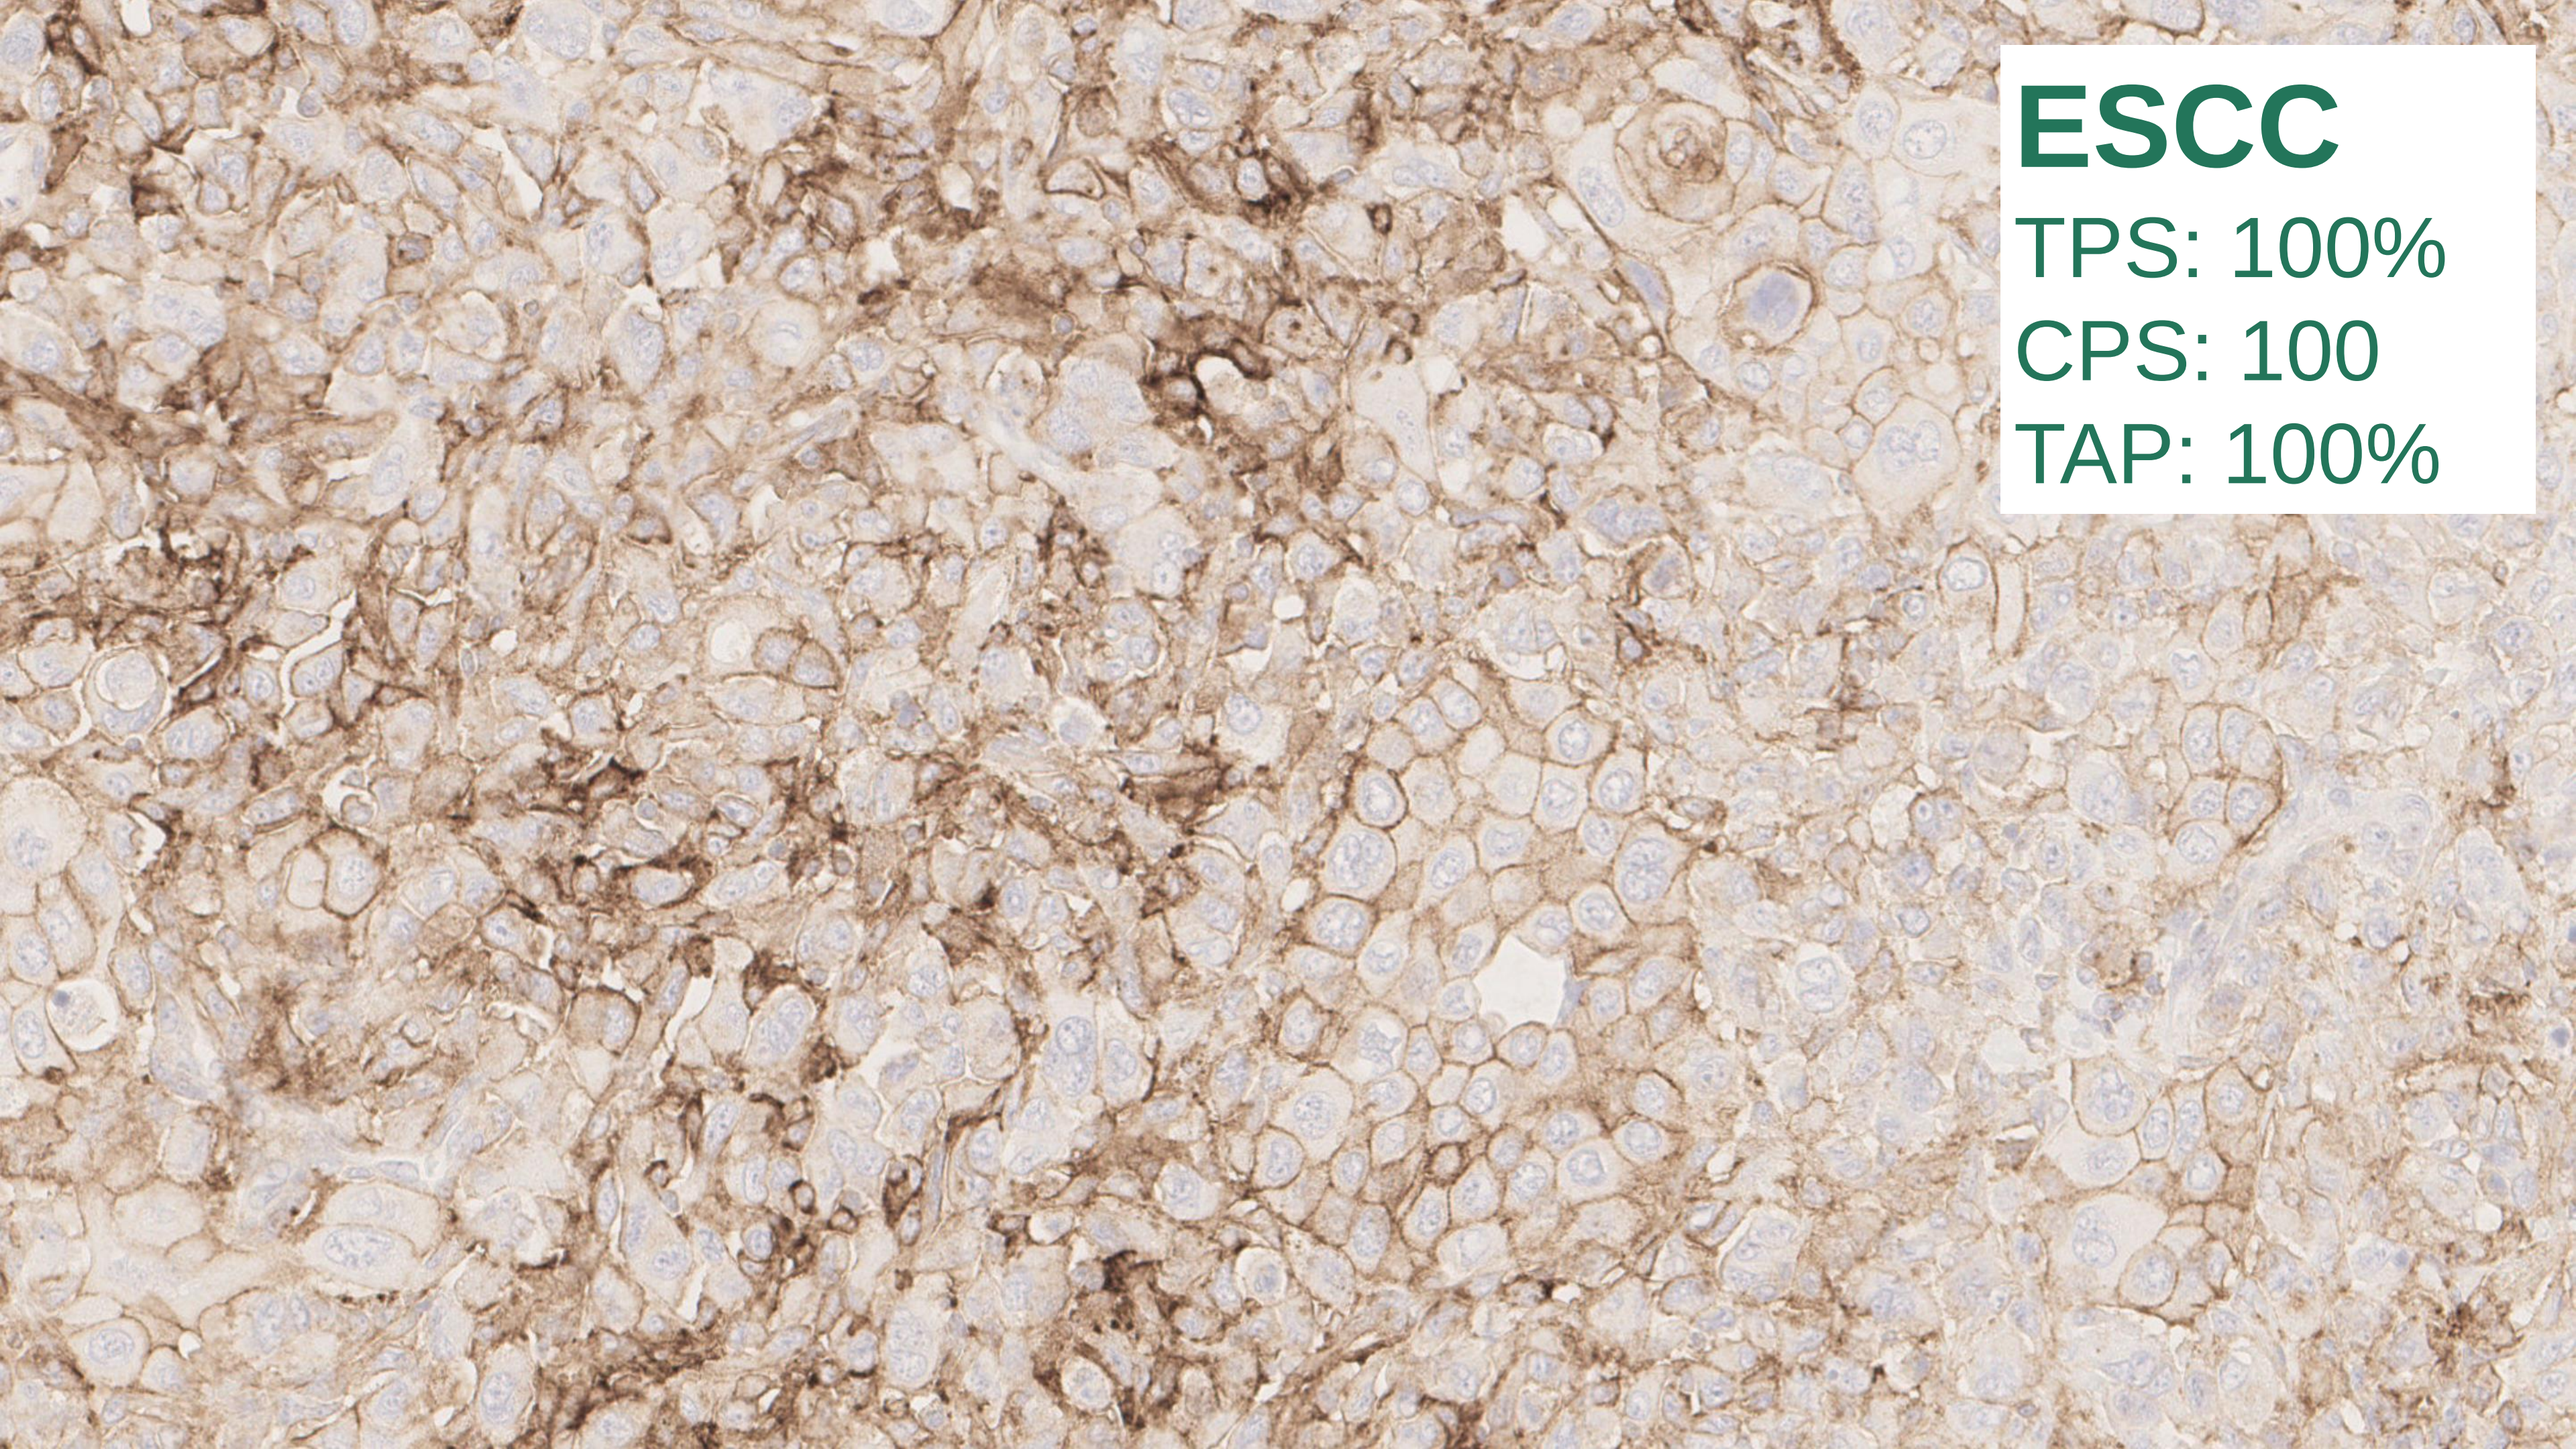
Visual estimation

TAP§

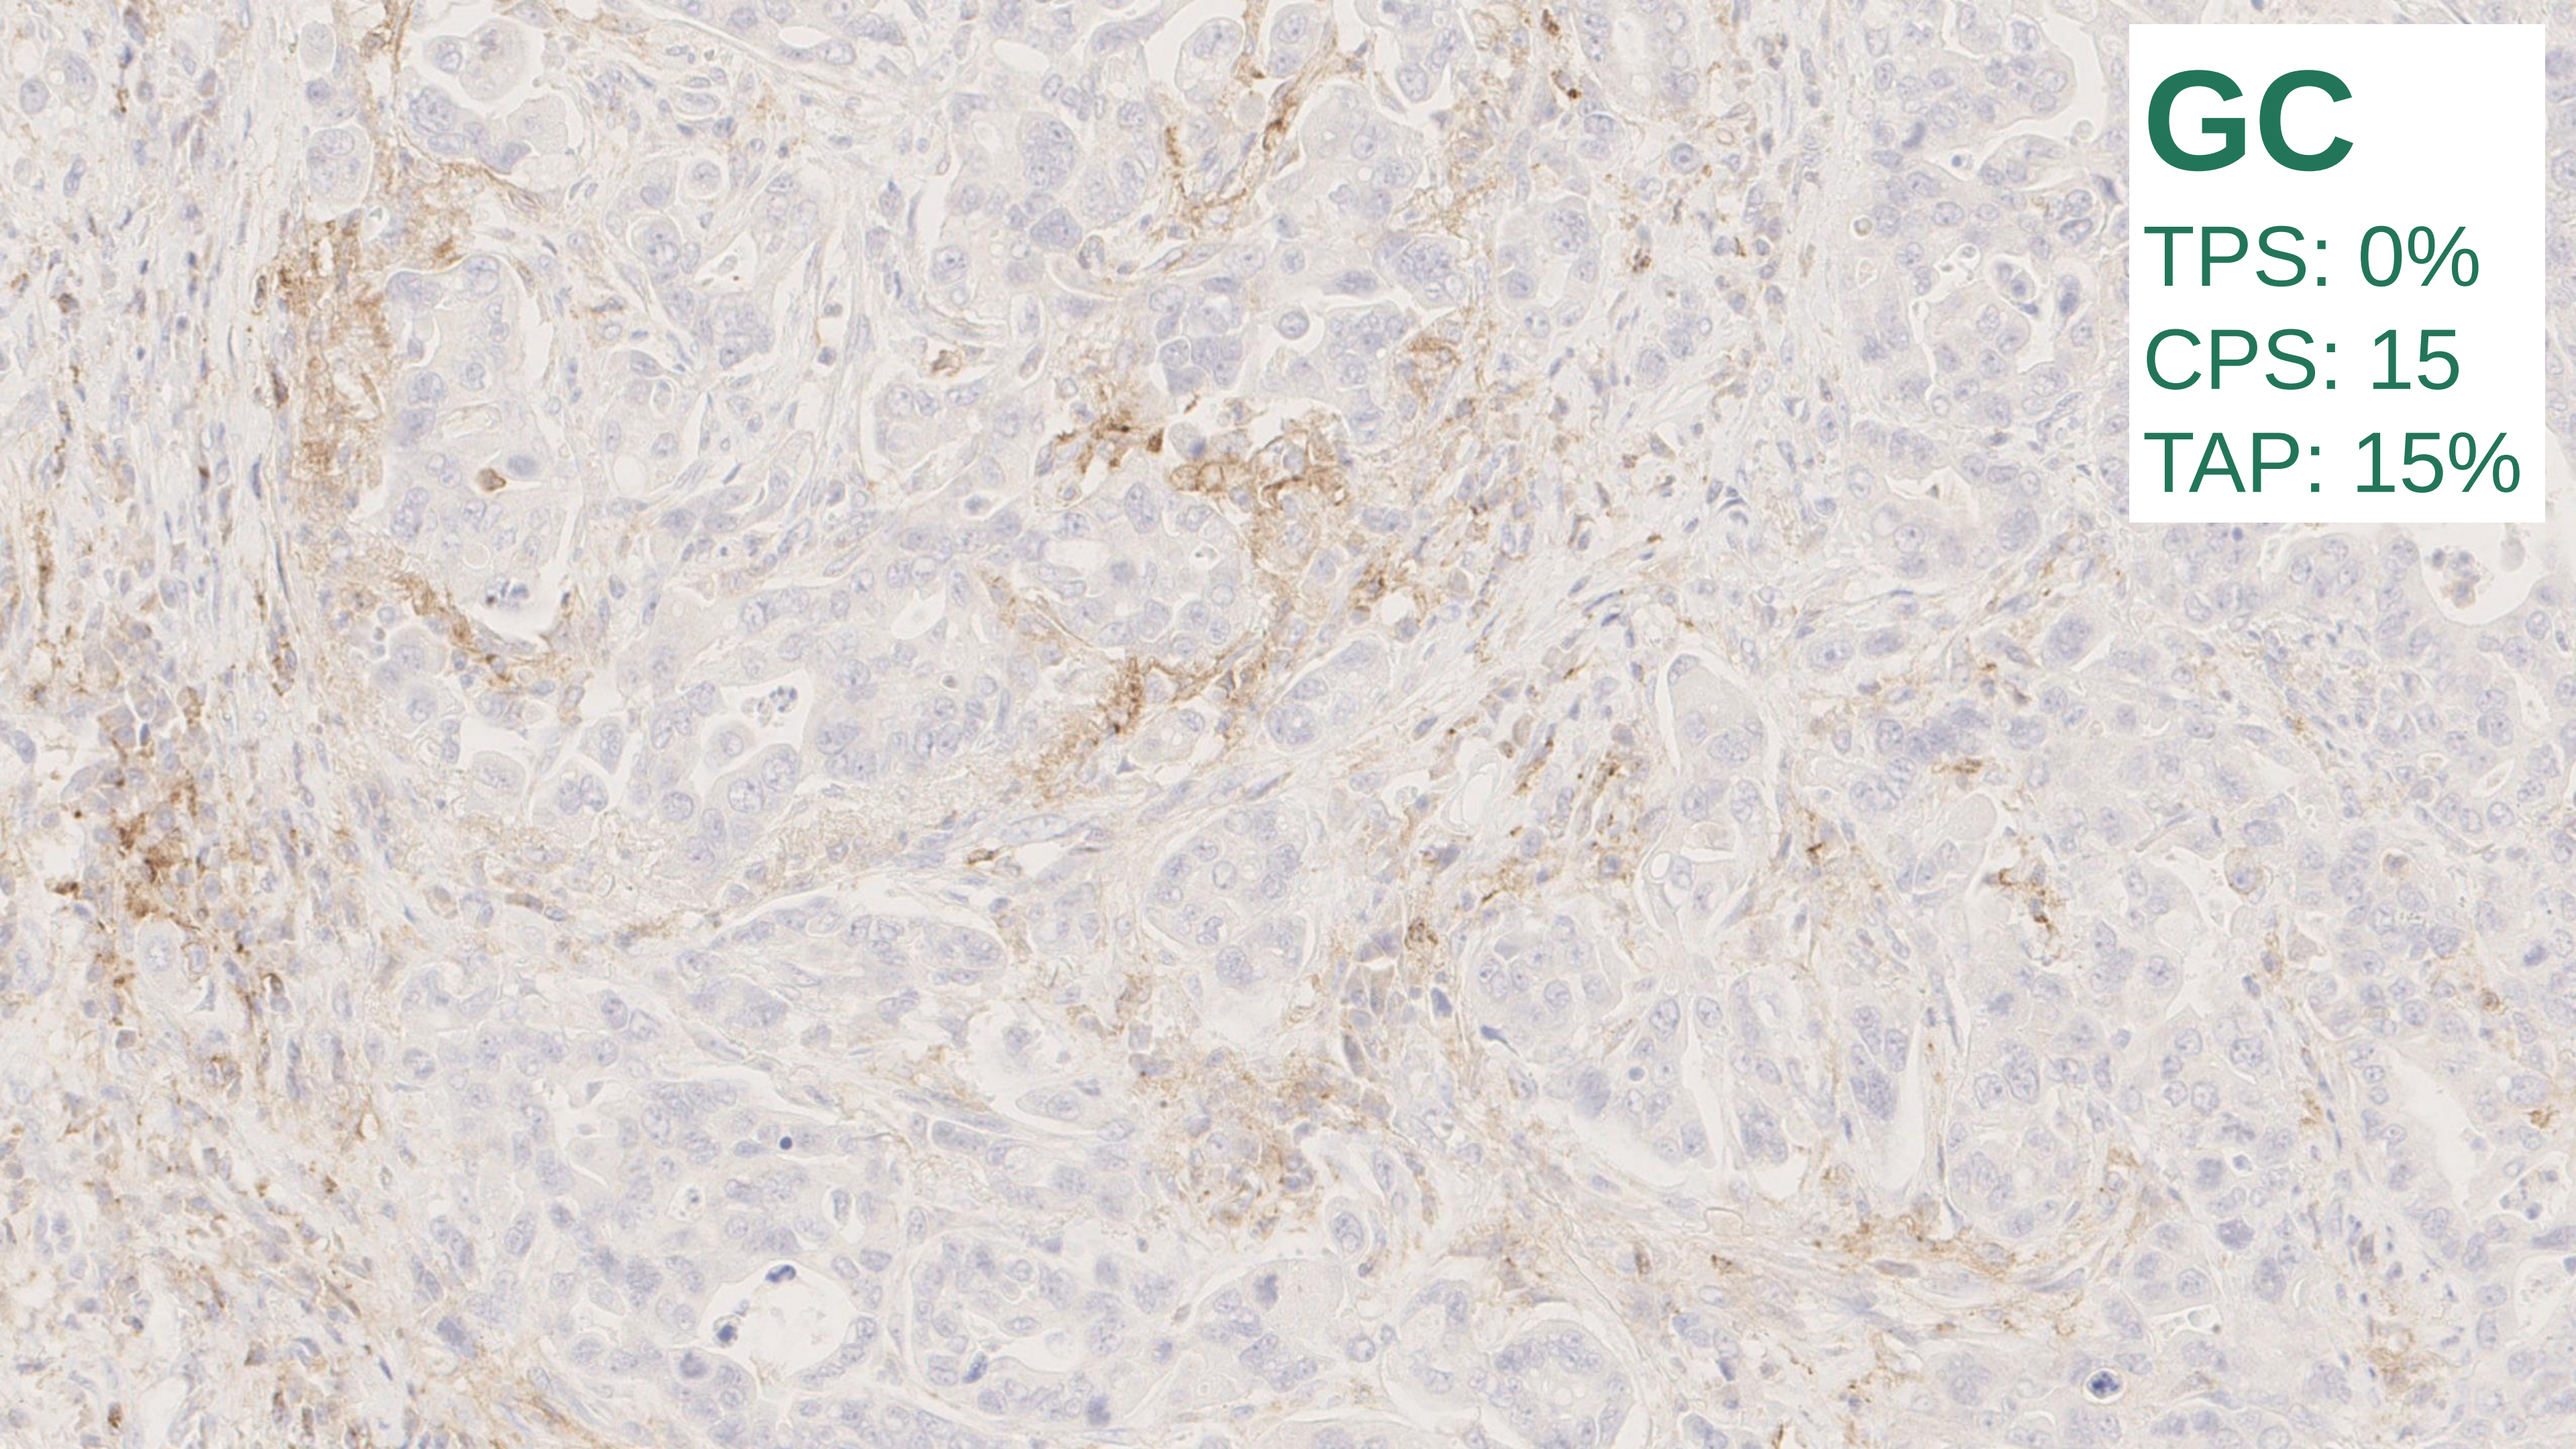
Area occupied by TCs with PD-L1 expression + Area occupied by ICs with PD-L1 expression

Entire tumor area

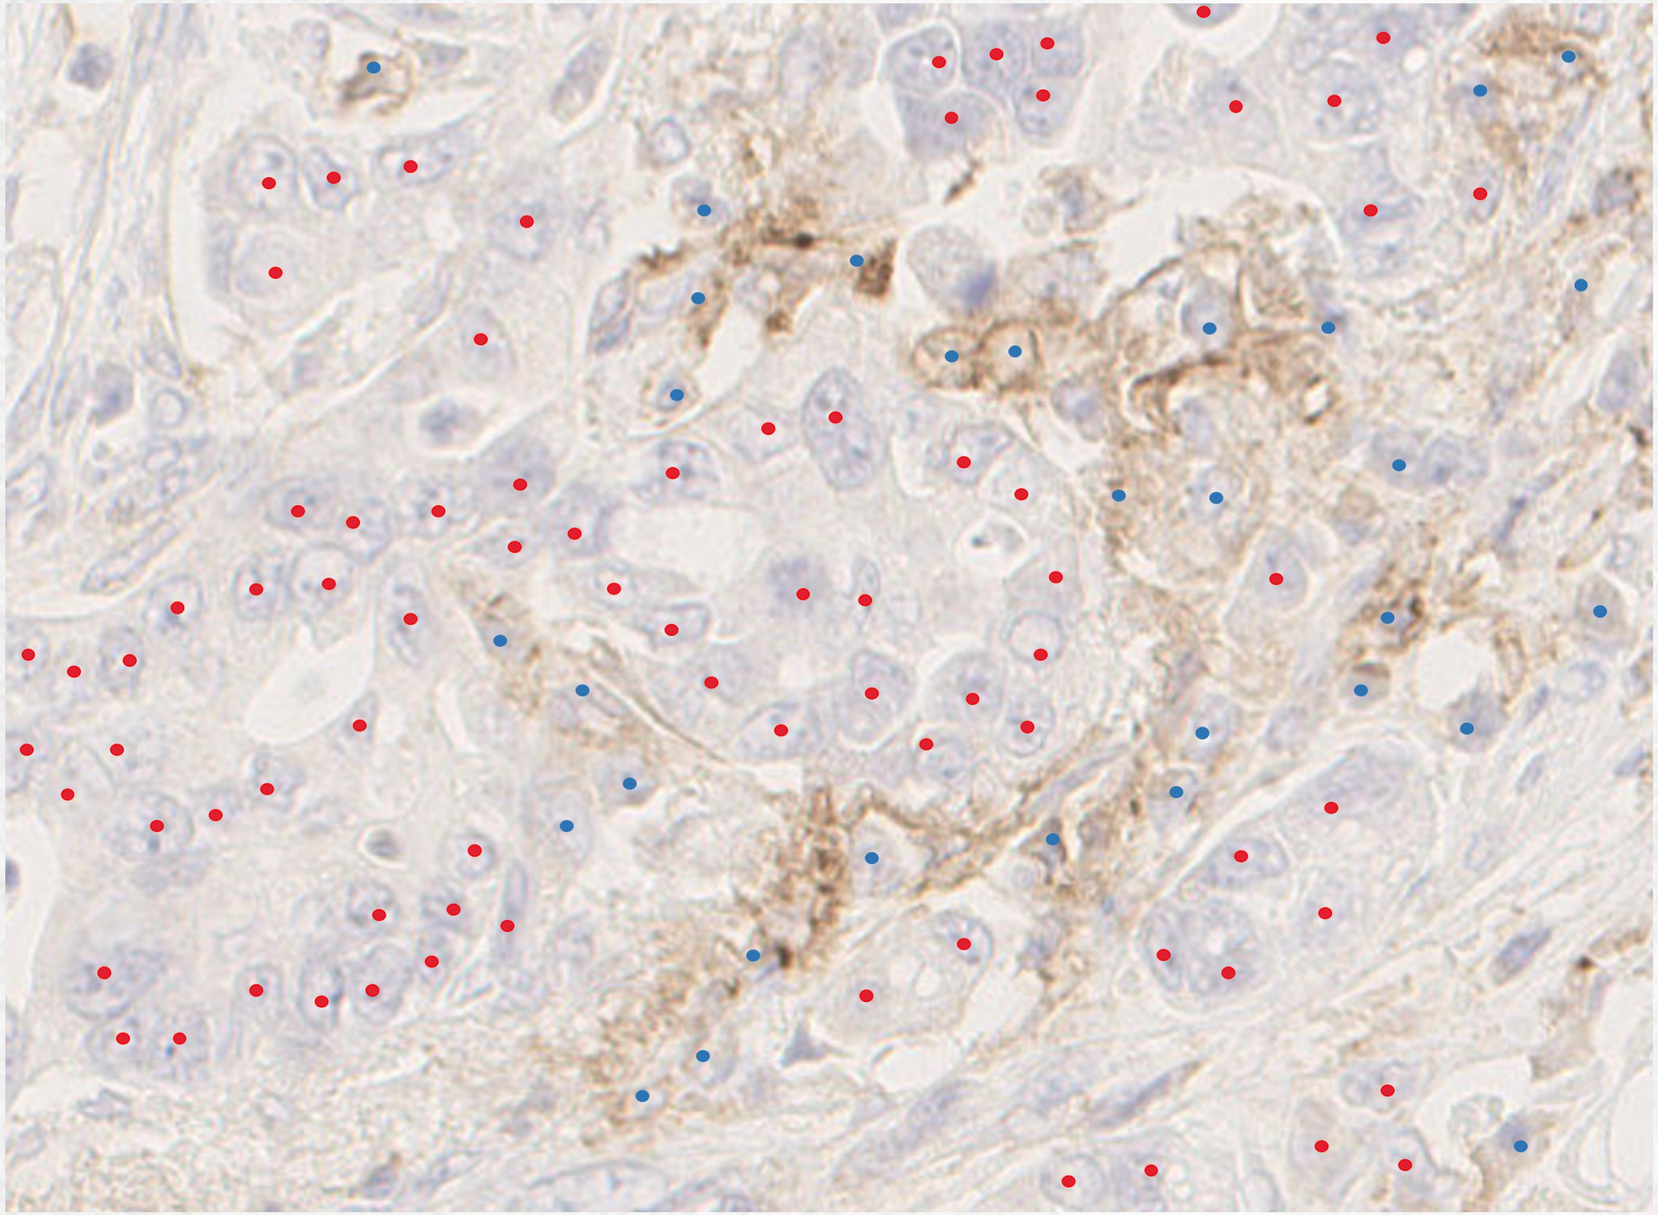
§inclusive of all types of ICs



ESCC
TPS: 100%
CPS: 100
TAP: 100%



GC
TPS: 0%
CPS: 15
TAP: 15%



TC: RED 100

IC: BLUE 25

Take home messages

- The pathologist should be aware of the clinical impact of the histology report
- Increasing number of biomarkers' portfolio: request for a more adequate tumor sampling/sample's sparing strategies
- Need for educational programs involving pathologists, lab technicians, oncologists, surgeons and gastroenterologists (es. PD-L1, preneoplastic lesions, MMR, CLDN18.2)!
